You asked for a balun for one band.

Your proposed solution works fine. It is a narrowband solution, which
is fine if you only want to work 20m.

Very widely used on VHF Yagis which are narrowband applications.

Some have written that the loss in feed to one side of the balanced
load (~0.2dB for RG213 at 20m) causes significant pattern distortion.
However, most baluns are not perfectly balanced.

And, if you assume the line is lossless, the voltage and current are in phase every 90 degrees along the line regardless of the amount of mismatch.

This is easily illustrated with a Smith chart -- choose any point you'd like, representing an arbitrary load impedance. Then draw a circle through that point, with the center of the circle at the chart's origin. Moving clockwise along this circle represents moving along the transmission line from the load toward the source. You'll cross the chart's axis, where the impedance is purely real, in a half revolution (90 degrees of movement along the line) or less, and cross it each half revolution (90 degrees) from then on.

1551. effect of metal pipe supporting a vertical cage antenna

Newsgroup: rec.radio.amateur.antenna
Date: 2006-07-31 12:12:41 UTC
From: David George Johnson <ercoupe@direcway.com>
Message-ID: <m5rrc29lnks7tadio21qp72aojh3mtmak1@4ax.com>
Source record: 55288

I want to put an eight wire vertical cage around a one hundred twenty foot steel support for 80 meters. I can center feed the cage with open wire line, which I assume will be more efficient than feeding the steel at the bottom. The cage will not be in contact with the ground or the tower. My thought is that the wires will make a better radiator than the steel, but I have no idea what the steel "core" will do to the efficiency of the antenna. I have had no success in modelling this antenna.

So my question is will the center fed, ungrounded cage dipole provide any real advantage over feeding the tower at the bottom?

Thanks.

Dave

There is going to be a LOT of coupling from the two halves of the cage dipole to the tower. It sounds like a recipe for disappointment to me.

As far as a radiator, the steel will work OK because it's got a lot of surface area. You could always cage it with wires connected at the top and bottom if you're worried about the conductivity.

I'd feed it at the bottom if I was lucky enough to have a 120 foot vertical pipe :-)

73,
Dan

Locating an amplifier at the antenna is a fairly common
practice both for transmitting and/or receiving.

If the line has losses, the SWR circle becomes an SWR spiral
but the spiral still crosses the purely resistive axis like
the circle does, just not at the same points.

Does your answer imply that the number of degrees between
purely resistive crossings is not equal to 90 degrees when
the line is lossy? (Not a trick question)

Remoting radios is nothing new and quite do-able. Signal line loss problems depend on the design of the remoting. ie if line drivers are used, not a problem. If high Z TTL lines then you might have a problem. Power supply will be a problem. It may be smart to also remote a large battery for current peaks. Easy to work out...

You may wish to address other issues though like lightning strikes and weather ingress..

I use to remote a linear amp and preamp with a remote NiCd pack of D cells. Worked well. RFO was about 70W on 144MHz.

Open wire feeder may also be an option to you.. The line loss would be lower. You could also make some out of small dia copper pipe and spacers you size/drill yourself.

Cheers Bob VK2YQA

You will find hanging a dipole next to a conductor will couple heavily... I suspect your cage dipole around the tower will cause you grief...
There has been lots of discussion on feeding galvanized steel towers with RF... The consensus is that the surface area of the tower makes up for it's lower conductivity... There appears to be little/nothing to be gained by straping a few, small diameter wires to the surface of the tower...
I have run 160 meter receiving tests where I switched between a steel quarter wave tower and a sloping vertical wire hung off another tower 240 feet away... Both monopole antennas a resonant quarter wave on 160... Relays used to detune the unused monopole..
There is no difference in the received signal strengths that I can find... At least for 80 and 160 I have no qualms about feeding the tower... I used to be a believer in adding wires up the tower face, but I have found the rapture...
If your tower is grounded and it is more than a quarter wave in height, you can make it into a folded unipole to allow feeding at the bottom... This will raise the feedpoint impedence, so you will have to use a parallel resonant tank circuit to match it... I find this better (in my twisted mind) than taping a few feet up the tower for a feed point... ymmv...

cheers ... denny - k8do

Make the loop square and resonant on 80... Make a mechanical switch of some sort so you can open the loop opposite the feed point... This will make 160 meters easy to match, and may even be helpful on higher bands to change the direction of the main lobes...

Hi David,

Certainly more complex as you would need to draw the feed off at right
angles for some distance (a quarterwave or more). Do you have a
second 60 foot tower at least that far away to string it out?

As Denny's experience shows, nothing really to be gained (except the
unstated bandwidth increase); and it could be done easier at ground
level feeding the skirt wires that are all connected to the steel mast
at the top. This cage is significantly larger than the mast diameter,
isn't it? It should be, or you are wasting your time.

>The cage will not be in contact with the ground

That's fine.

>or the tower.

It should be, at the top, as stated above.

>My thought is that the wires will make a better
>radiator than the steel, but I have no idea what the steel "core" will
>do to the efficiency of the antenna. I have had no success in
>modelling this antenna.

That is a fairly trivial task: select a sufficient "wire" diameter,
and choose the loss of steel. In the end, for a fat wire, it won't
matter much at the lengths and wavelength you are describing.

>So my question is will the center fed, ungrounded cage dipole provide
>any real advantage over feeding the tower at the bottom?

Nope.

Yes, I did think of temperature concerns. The radio unit itself should
be kept at above freezing if my calculations are correct. However,
does the antenna need to be kept warm?

Do you mean that I should be able to pick up a signal from 300 miles
away??? I don't believe I understand the forces at work here.

I was hoping to only put an antenna on the vehicle that I chase the
balloon with. It weighs too much to put it on the balloon itself.
However, would it decrease my performance that much??? I asked this
similar question to Aerocomm(who manufactures the radios). They sent
me two possible antennas, but I'm not sure either is really what I
want.

I'm not really sure how much data is transmitted. You need to check
out the product description for these devices. From a programmer's
perspective, I don't need to do any initializing of the radio.
Whatever data I transmit out of the serial port is what shows up out of
the other radio's serial port. Pretty basic. I am not planning to
send images back, just little bits of data. But I would like the
reliability of the connection to be such that I could send back a photo
if I needed to.

It would be nice if somebody could give me a link to a website where I
could buy the proper antenna with a proper connector.

Here is the e-mail from Aerocomm:

You can try one of the antennas that I have attached information on.
The panel offers better overall coverage while the yagi is more focused
and covers longer distance. These are not officially approved for use
by the FCC. Remember that the ConnexLink has a reverse polarity SMA

jack for the antenna connector.

Thanks for all the replies!
Brett

After further thought, I think Roy's point is that a lossless
transmission line has a purely resistive Z0 so the voltage
and current are in phase every 90 degrees. Z0 is not purely
resistive for ordinary transmission lines. But real-world
distortionless lines are indeed lossy while possessing a
purely resistive Z0.

If the radio is the CL4790-1000 it is rated to -40C. For short term exposure to cold, have you considered a small thermal blanket? It is drawing 5 watts from the battery and power output is one watt. So, you have 4 watts of heat. Possibly enough for a small thermal blanket.

Antenna should not require any heating element.

Hi Brett,

These are commercial antennas, the first is what you might use in your chase car. It exhibits gain from the complexity of its design. It also exhibits a sharp lobe that is inconsistent with use on a balloon (unless you add tracking servos - yeh, you are not going there).

>It would be nice if somebody could give me a link to a website where I
>could buy the proper antenna with a proper connector.

If you have such a tight weight budget, you should be doing it yourself. Packaged products are always heavier. You "could" get away with a simple piano wire stinger stuck into the transmitter's jack.

YEP! Three hundred miles away IF ... IF the balloon is at 100,000 feet altitude!! The specs read "line of sight".

At an altitude of 10,000 feet the radio line of sight horizon is about 120 miles.

A typical UHF [900 MHz] receiver should be able to receive a signal as weak as 0.0000000000002 [2E-14] watts [1 uV] using a simple vertical antenna. Three hundred miles line of sight from 100,000 feet altitude is approximately 1.4E6 wavelengths. The power density at 300 miles from a 100,000 feet high balloon is approximately 8E-14 watts/wavelength^2 [2 uV]. The signal should be heard, but the noise margin is low for reliable digital data transmission. A gain antenna at the receiver will improve the signal to noise ratio significantly.

The forces at work here are simply the receiving sensitivity of your earth bound receiver. Ham receivers have sensitivities less than 1 uV.

The power divergence from the transmitter was assumed spherical for 1.4E6 wavelengths, and the receiver was assumed to have 1 uV sensitivity.

Above is for the balloon. Below is for the chase vehicle.

Either antenna should do the job. The hg908Y would let you eyeball sight along
the axis in the general direction of the balloon. Both are gain antennas.

If the characteristic impedance of the transmission line is 50 ohms, then there are no reflections; furthermore the current and voltage are in phase at every point along the line, There are no standing waves in this case.

In fact it doesnt matter how long the line is as long as it is terminated in its charcteristic impedance. This case corresponds to the circle in the middle of the Smith Chart on which the impedance is constant.

It doesn't matter what the characteristic impedance of the
transmission line is as long as it is an electrical 1/2WL. As such,
you can have reflections, feeding a 50 ohm resistive load, and the
voltage and current will be in phase 1/2WL back fron the load. Antenna
matching with transmission line transformers use different impedance
transmission lines to wind up with a perfect match.

Hi Brett

In most cases, the transmitter will be in an enclosure. I'm assuming that there will be an experiment package. Many who do this sort of thing will make the enclosure out of Styrofoam. Some actually use styro picnic coolers. For typical flight durations, the inefficiencies of the electronics equipment on board the payload (read waste heat) will make up for the nasty temps outside. I've seen some cases where there has actually been a temperature rise. The criteria is a well sealed insulating box.

And no, the antenna itself does not need to be warm. Just seal off the exit port to keep internal heat from leaking out.

Your watt should be sufficient power. At 100 kilofeet, you will reach more that you likely want to reach! I've seen propagation maps that show a single balloon repeater at these heights covering 1/3rd of the US.

I haven't taught this subject at the University level for a few years now, so my terminology is a little rusty. VSWR = (1 + abs(rho))/(1 - abs(rho))

When the reflection coefficient rho is +/- 1 the VSWR is infinite. When rho = 0 the VSWR is 1:1. A VSWR of 1:1 corresponds to the unit circle at the center of the Smith Chart.

Hi Bob, I have never taught at the University level myself, this is an
"Amateur" newsgroup. If you look at the Smith Chart, 1/2WL reflects
back the identical load impedance, no matter the transmission line
characteristic impedance (neglecting losses). If you have a 1/2WL 600
ohm line driving a 50 ohm load, then you have reflections (SWR), but at
the source end, you see 50 ohms (V and I in phase).

I have been an amateur continuously since I was 13: 1963.

Transmission line: 1/2 half wave repeats the load, 1/4 wave inverts the
load.
That I knew in Jr High.

Finally understood it when I studied E&M in college.

> Radial_3 estimates VF.)

Reg,

I have done some computations around a 2 m radial length. I noticed
that I had made an error in my previous calculation at exactly 2 m.

1.8 m -- Radial Z = 70.17 - j 24.1
1.9 m -- Radial Z = 68.5 - j 19.0
2.0 m -- Radial Z = 67.2 - j 14.2
2.1 m -- Radial Z = 66.2 - j 9.5
2.2 m -- Radial Z = 65.5 - j 5.0
2.3 m -- Radial Z = 65.1 - j 0.6
2.4 m -- Radial Z = 65.0 + j 3.6
2.5 m -- Radial Z = 65.2 + j 7.8
2.6 m -- Radial Z = 65.6 + j 11.7

I can keep going if you think that these are the results
you expected. I am tempted to continue, in steps of
0.1 m, and plotting the results on the Smith Chart.
I expect the data to rapidly spiral to the center of
a chart normalized at 101. 6 ohms.

But I didn't say Z0 equals 50 ohms. What if Z0 equals 75 ohms?
300 ohms? 450 ohms? 600 ohms? Assuming lossless lines, those
Z0's will all result in 50 ohms looking into them when they
are 1/2WL long. Thus the voltage and current will be in phase
for 1/2WL no matter what the characteristic impedance and no
matter what the SWR.

And when SWR = 1:1, that circle has a radius of zero, i.e.
it is a point at the center of the Smith Chart.

But it seems to me that no matter what the Z0, whether purely
resistive or containing some reactance as does ordinary transmission
line, on a line with reflections, there will be a point where the
ratio of net voltage to net current has the current leading the
voltage and a short distance away, the current is lagging the voltage.
In between those two points, it seems to me that there must exist a
point where the voltage and the current are in phase. How could the
net (virtual) reactance go from capacitive to inductive without having
the voltage and current in phase at a point in between?

==========

Frank,

Very interesting!

I am plotting graphs of R and jX versus length of radial.

Joining up the dots I expect to see shallow sinewaves superimposed on fairly level mean values.

At present there is a definite shape of curve appearing in the reactance values while the resistance values are still fairly level.

As length increases I expect to see something similar happening to the resistance curve which seems to be in between peaks and troughs.

From now on it seems safe for you to increase length in increments of 0.2 metres. There is no danger of missing peaks and troughs in the curves.

Please keep up the good work.

1594. Balun question and shielded loop

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-01 11:44:51 UTC
From: Dominique Michel <dominique.michel@citycable.ch>
Message-ID: <20060801134451.7b268bb0@localhost>
Source record: 55181

I want to made a broadband receiving loop. It will be a one turn
shielded loop of around 2 meters in diameter. The frequencies I want to
be able to receive are the broadcasting band in Europa, LW (153 - 279
kHz), MW (531 - 1620 kHz) and SW (2310 - 25820 kHz). The antenna will have enough gain for the
SW, but less gain on the 2 other bands.

At the base will be a little box with the connection to the loop and a first balun 1:1 symmetrical to asymmetrical. The signal will just do a few centimeters to another box (a big one), and to an adjustable capacitor (a tuning cap from an old vacuum tube radio, so I can have a little motor to tune remotely the frequency of the loop).

I plan to have a preamp, but only for LW and MW. It will have a higher maximum gain at low frequency, and this gain will be adjustable remotely with a voltage.

Is it possible to do a such 1:1 balun with a bandwidth from 150 KHz to around 25 MHz and if yes, how?

Another question is the size of the loop. I try a few coaxial cables to do the loop, and get a self resonance frequency of the loop between 8 to 11 MHz. So, the tuning cap work very well under this frequency, but its effect is hard to define above this frequency. If I decrease the size of the loop, I will get less signal, but the cap will work in a linear fashion on all the SW band. If I keep the same size, it work well, but the effect of the cap is hard to define above the self resonance frequency of the loop. And what about if I increase the size of the loop?

Cheers,
Dominique

====================================
A further comment -

It may not be obvious, but a number of ferrite sleeves sliding over
the transmissiom line, either coax line or twin line, corresponds to a
single turn of line passing through an elongated ferrite ring.

The formulae for calculating choking inductance, from dimensions and
number of turns, is the same for one ferrite ring and a single or a
number of sleeves.

Obviously, there is more heavy, ferrite material used for sleeves
because the number of turns is only one. But disregarding economics, a
number of sleeves will eventually provide a better very-wide-band
choke than a ferrite ring or a bundle of ferrite rods.

Rich, intelligent, technical perfectionists, using high power, with
plenty of spare time, are the most likely people to win contests.

Reg.

Amidon specifies a typical Z for those toroidal coax sleeves.
For instance, the Z is 215 ohms per core for FB-77-5621
cores at 25 MHz. My store-bought G5RV came with eight of
those cores.

1.8 m -- Radial Z = , I have reached 7.4m, but there does not seem
any point in continuing. Let me know what you think. It does not
appear to be behaving as I would expect of a transmission line;
but then I have no experience of transmission lines immersed
in a lossy material.

Also note the jump in impedance at 5.6 m. I double checked the
result, and it appears to be correct.

2.8 m -- Radial Z = 67.5 + j 19.2
3.0 m -- Radial Z = 70.6 + j 25.9
3.2 m -- Radial Z = 74.7 + j 31.6
3.4 m -- Radial Z = 79.8 + j 36.0
3.6 m -- Radial Z = 85.5 + j 39.0
3.8 m -- Radial Z = 91.4 + j 40.4
4.0 m -- Radial Z = 97.1 + j 40.2
4.2 m -- Radial Z = 102.0 + j 38.6
4.4 m -- Radial Z = 105.9 + j 35.9
4.6 m -- Radial Z = 108.6 + j 32.7
4.8 m -- Radial Z = 110.1 + j 29.3
5.0 m -- Radial Z = 110.5 + j 26.1
5.2 m -- Radial Z = 110.1 + j 23.3
5.4 m -- Radial Z = 109.2 + j 17.2
5.6 m -- Radial Z = 107.9 + j 19.5
5.8 m -- Radial Z = 106.5 + j 18.4
6.0 m -- Radial Z = 105.1 + j 17.7
6.2 m -- Radial Z = 103.8 + j 17.5
6.4 m -- Radial Z = 102.7 + j 17.6
6.6 m -- Radial Z = 101.7 + j 17.9
6.8 m -- Radial Z = 101.0 + j 18.4
7.0 m -- Radial Z = 100.5 + j 19.0
7.2 m -- Radial Z = 100.2 + j 19.6
7.4 m -- Radial Z = 100.1 + j 20.2
.
.
8.0 m -- Radial Z = 100.5 + j 21.4
.
.
9.0 m -- Radial Z = 101.8 + j 21.7

These data are so close to the center of a Smith Chart
normalized to 101.6 + j 21. Not sure how you
normalize with a complex number, but assume it is
with the magnitude of Z.

You know what I think would work better? Four slopers running off at
different angles, 45 degrees from the top of that 120 foot mast. You could
even tune the unused slopers for a better pattern.

Even three slopers would do it, I think.

1600. Re: Balun question and shielded loop

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-01 17:31:24 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <12cv3vfi3sqhgfd@corp.supernews.com>
Source record: 55187

In order to be effective, a balun's common mode impedance has to be at least several times greater than the common mode impedance of the antenna. The common mode impedance of a very small loop like that will be very high, so it won't be possible to make an effective balun, except perhaps at the high end of your frequency range.

I suggest that you use a "shielded" loop. This is a technique to improve the balance. Also take as much care as you can to keep the loop physically symmetrical.

A frequency range of more than 150:1 seems ambitious to me, but I'll defer to folks who have more experience with loops than I do.

Roy Lewallen, W7EL

> At the base will be a little box with the connection to the loop and a first balun 1:1 symmetrical to asymmetrical. The signal will just do a few centimeters to another box (a big one), and to an adjustable capacitor (a tuning cap from an old vacuum tube radio, so I can have a little motor to tune remotely the frequency of the loop).
>
> I plan to have a preamp, but only for LW and MW. It will have a higher maximum gain at low frequency, and this gain will be adjustable remotely with a voltage.
>
> Is it possible to do a such 1:1 balun with a bandwidth from 150 KHz to around 25 MHz and if yes, how?
>
> Another question is the size of the loop. I try a few coaxial cables to do the loop, and get a self resonance frequency of the loop between 8 to 11 MHz. So, the tuning cap work very well under this frequency, but its effect is hard to define above this frequency. If I decrease the size of the loop, I will get less signal, but the cap will work in a linear fashion on all the SW band. If I keep the same size, it work well, but the effect of the cap is hard to define above the self resonance frequency of the loop. And what about if I increase the size of the loop?

Reg:

It seems that the Smith Chart must be normalized with a
complex number. As expected, with a very high loss

transmission line, the impedance rapidly spirals towards the complex Zo. From the data it is not clear what is really happening, but on the Smith Chart it becomes very clear. The curve crosses the "Real" axis at: 2.8 m, 5.8 m, and about 9 m. At this point the data are so close to the Smith Chart center that any more results are irrelevant. Even without a Smith Chart, normalization of the data will clearly reveal where the quarter wave multiples are located.

Why on earth would anyone live in one of those places? And yes there are alternatives. I live in a development that doesn't have that that kind of insane meddling going on. I can have a tower even, as long as it has enough room to fall down within my yard and not hit the neighbors.

Couldn't agree more. Move away from the Fascist Homeowners Association
and get in an area where people know enough to leave each other alone!
Your blood pressure will go down, your enjoyment of life will go up
and you might live long enough to Work All Stations.

Ok, a tad exaggerated but you get the idea.

Isn't the elimination of the rights of property owners more of a
Socialist ideal? That characterization would be a bit more consistent
with the "climate" here in this state.

No, it's definitely fascist, bundle of sticks and all that. Uniformity at all costs. Oddly, at their extremes, fascism and socialism sort of meet.

Barney Fife is a fascist,
Barney Miller is a socialist.
Barney the purple Dinosaur is politically unaffiliated.

These people are usually too dumb to associate a wire with an antenna. Try
jamming a length of #30 wire out the top of a window, and throw the other
end as far up a tree as you can.

Frank,

I don't understand Smith Charts.

But you can tell me what conclusions the charts lead you to believe
about the behaviour of a lossy transmission line of various lengths.

I am concerned with reducing the uncertainty of my program from the
information contained in the graphs of input impedance versus length
which I am now able to complete.

<joke> I don't suppose you would like to repeat the excercise using a
ground resistivity of 1000 ohm-metres. Or repeating at 20 MHz. <joke>

------------ REPLY SEPARATOR ------------

Maybe. Socialism has to do with ownership, fascism has to do with
control. Obviously there can be some overlap.

A quote from dictionary.com:

"Fascism:

A system of government marked by centralization of authority under a
dictator, stringent socioeconomic controls, suppression of the
opposition through terror and censorship, and typically a policy of
belligerent nationalism and racism."

Sounds like a Homeowners Association to me. :-)

Sooo, are we investigating behaviour of lossy transmission lines heating the worms, aka wire in a dirt, or behaviour of radial within the vertical antenna, aka the other half of a "dipole" and it's participation in forming the radiation pattern and effciency?
Helooooo?!? What's next? Shortening the radiator?

As a test case, see how "inefficient" is the 3/8 wave vertical, with 360 3/8 wave radials on 160m.
If your "software" tels me that it will be more efficient with 1 m radials, you are in for serious reality check.

Hi Bill,

They: the Homeowners Association
signing statement: a Fascist rewriting of a contract already entered
into.

I can anticipate a "no" in response to my question, and as such the
Homeowners Association ceases to qualify for the current state of the
Fascist art.

> SW, but less gain on the 2 other bands.

I agree with Roy... Pretty ambitious range you want... I'd concentrate on the LW, and hope for the best as a "random" antenna for the upper HF ranges.. There is really no such thing as a "broadband" small loop, unless you do some drastic designing. On those lower frequencies the tuning will be very sharp. You will want to retune the cap for most any large frequency change. Being the self resonant frequency of a true LW loop using practical value variables is going to be low, there is not much point in trying to use it for higher frequencies unless
you can live with it as a random antenna. I'd have a 2nd loop for the higher bands. Also one turn 2m dia? Good luck on LW... You are going to need some high pf cap values.. It would probably be more practical to use a multi turn loop if you want to use the average BC variable. Depends on the cap. The average dual gang variable for old AM radios were usually about 365pf x 2 for a total of 730 pf. Some caps in old AM/FM receivers have more gangs, and a bit higher total..
I've got a diamond loop next to me that is 44 inches per side. It has 5 turns. With the variable cap I have, my low end is 500 kc. To tune LW,
I must add on extra fixed caps. Using all the gangs, my upper limit on MW is about 1300 kc?? or so. I forgot exactly, but I think it's below the
upper end of the MW band. I have to switch to a single small gang to tune higher frequencies. My upper limit is about 2300 kc or so... And thats with a very small cap value.. Sure, I can listen on HF, but it will
never be properly tuned. A small loop is not that great an antenna for the HF bands anyway.. You would probably be better off to string out a wire..
BTW, I don't use a balun or a preamp on mine. I realize that the unbalanced
to balanced connection is not the greatest thing, but in the real world,
it's pretty much a non issue once the antenna is tuned. I notice very little skewing of the pattern, and have had no noise issues. Using a shielded loop, or shielded coupling loop can help balance if it ends up

being a problem, but in comparing both shielded and non shielded
coupling loops, I saw very little difference. My antenna is well
balanced
and symmetrical, so that probably helps.
I've never needed the preamp.. Plenty of signal as is. Will vary to the
radio.
If you tune the loop so it actually will tune HF, you won't be able to

properly tune it for LW using a BC variable cap. And LW and MW is
where you really want the loop. You can use anything for HF...
Reg has a pretty decent program for "what iffing" small loops..
"rjeloop3"
You might check it out. You will be able to see your appx ranges using
the
caps you have, number of turns, etc.. I've compared it with real loops
and
it's close nuff fer gov work.

Frank,

To complete the graphs of Rin + jXin versus length for one radial, I need data for lengths between 0.5 metres and 2 metres at intervals of 0.2 metres.

Could you oblige please?

The nice smooth graphs I have produced so far are free of 'measurement' errors which could be attributed to your hard, tedious work.

The uncertainty due to NEC4 is as yet unknown. In the NEC4 model of a single radial, what is the length of the short bits of radial used to model it? Alternatively, into what number of short lengths is the radial under test divided?

Reg, G4FGQ.

I was thinking to use an additional balun between the cap and the antenna for the MW band and another one for the LW band, so at the antenna see a capacitance value multiplied by the power of the rate of the balun.

2 loops or one loop and a vertical antenna can be an option, one for LW and MW, the second one for SW.

I just received the balanis, and it have an extended chapter on the loop. I have just begun to read it. It appear at, with a big loop as my 2 meters diameter on SW, the resistance as the reactance of the loop show a very big and very sharp increase when the circumference of the loop is between 0.4 and 0.6 wavelength. So, in fact, a bigger loop as a 2 meters diameter will be needed, but I cannot use a coaxial cable if I want to be able to tune it (too much parasitic cap). So maybe at a vertical will be better because I don't know if I can manage a so big loop where I am living.

Thank you.

If I want to model a such shielded loop for spice, do you know if it is just to model a normal loop and add the capacity between the core and the shield?

2 loops can be an option, or a loop for the LW and MW bands and a vertical for the SW band.

Bset,
Dominique

> >
> > Another question is the size of the loop. I try a few coaxial cables to do the loop,

and get a self resonance frequency of the loop between 8 to 11 MHz. So, the tuning cap work very well under this frequency, but its effect is hard to define above this frequency. If I decrease the size of the loop, I will get less signal, but the cap will work in a linear fashion on all the SW band. If I keep the same size, it work well, but the effect of the cap is hard to define above the self resonance frequency of the loop. And what about if I increase the size of the loop?

I am a Canadian with serious chronic health problems and I have much more experience with the health system than I would like to have, I have come close being a silent key several times, I am sure that there are some who feel that is too bad that I was allowed to breed before my medical problems became obvious. In the minds of some I suppose that I have peed in the genetic pool.

I have never heard of a Canadian hospital shutting down because the money did not last until fiscal year end. While there are some weaknesses in our system such as delays in elective procedures but when the sand was running out of the hour glass there was always a system to help me out. Here everyone can get insured, there is an option to opt out of medicare but who would?

Think of the overhead that American doctors face having to deal with multiple insurance companies, each with different forms and procedures. Think of the people who can't get medical insurance no matter what the cost. Think of those who don't have because they can't afford it. And then there are those who exercise their right not have it.

In a situation where people get treated but can't afford to pay, the rates for everyone else must go up to compensate.

Canada is not perfect but it is a pretty nice place to live and we try to contribute as best we can.

By the way, if I were an American I would vote republican but I am not a single issue voter so don't construe that to mean that I from the far right wing. Consider me a fiscal conservative with a social conscience.

No problem Reg, here are the data you requested:

0.5 m -- Radial Z = 167.6 - j 161.0
0.6 m -- Radial Z = 146.6 - j 136.3
0.8 m -- Radial Z = 115.9 - j 102.3
1.0 m -- Radial Z = 101.4 - j 79.1
1.2 m -- Radial Z = 89.4 - j 61.5
1.4 m -- Radial Z = 80.9 - j 57.2
1.6 m -- Radial Z = 74.6 - j 35.0
1.8 m -- Radial Z = 70.2 - j 24.1
2.0 m -- Radial Z = 67.2 - j 14.2

Concerning your previous question about the Smith Chart.
It is a powerful visual aid which gives a better understanding
of what is really happening to the impedances. Exactly what
I got out of graphing the data was really only a confirmation
of the expected spiral toward Zo. Also the "zero-crossing"
which occurs at quarter-wave multiples.
Normalization of the data (Division of each complex datum
by the complex Zo), and linear graphing, will also provide
the same information; including the gradual approach to the
normalized Zo of 1 ohm.

Where the Smith Chart really proves its worth is in the
design of matching networks involving: L, C, R, and
transmission lines. It is hard to imagine how anybody

could do such design without this aid. I am not sure
if anybody actually uses the paper versions these days,
but the software equivalent, combined with programs
such as (Now Agilent's) Eagleware, are pretty much
design lab standards.

In this model all segments are a constant 10 cm in length.
The number of segments will therefore be L(m)/0.1.

Frank

Some tricks are tape to a #30 wire in the corner of the floor or the ceiling...
Or you can form a horizontal loop -around the 4 walls of the room...
Run 300 ohm twin lead up to it and use a tuner..
You can form a vertical loop against one wall of the room by running the wire around the corners...
Or run a wire under the rugs to the patio door... Screw the end of the wire to the door frame.. Again, use a tuner on the wire.
Run a wire out a window or door and up a corner of the wall to the gutter (if metal) and scew into it... Again, use a tuner... If the gutter is plastic, continue the wire along inside or behind the gutter...
A wire out a window and up to a tree (as another mentioned)...
Put up a flag pole with a flag.. Pole is, of course, your vertical antenna... Run a coax cable out to it..
Put a mobile antenna on your car... Run a coax from the radio to the car... (remember to unhook before leaving :)

Hi Bill, can you tell m something about your setup with the roller inductor. I tried it and was not very happy with it. I guess I could have tried a slower motor and it seemed like it require cleaning a couple of times a month. I still have the old stuff around and may try it again if I thought I could get it to work better.

May I insert a few words about the Smith Chart?

During the period between 1958-59 I designed the entire antenna system and matching harness for the World's first weather satellite, TIROS 1, which was launched April 1, 1960.

Four transmitters operating simultaneously on separate frequencies fed the antenna that comprised four crossed monopoles radiating right circular polarization from two transmitters and left circular polarization on the other two frequencies.

The point concering the Smith Chart is that the only tools I had for the development of both the antenna system and the matching harness was the

Hewlett-Packard HP-805 slotted line for impedance measurements, the slide rule for calculations, and the paper Smith Chart to tell me where I was in the desert. The resolution available with the Chart was sufficient to make the system work successfully. Philip Smith was my hero.

Incidentally, the matching harness was fabricated entirely of printed-circuit stripline, and that was 47 years ago.

I know a guy who lives on an upper floor who has laid 65 feet of wire
around his baseboard. He has a fairly good signal on 75 with it!

In your case, you might try running it around the wall at ceiling height.

Walt,
Could you please tell me a little more about that satellite? Reason I
ask is there is a place I am sure you can enlighten us on, called Camp
Evans.
I know there is still a big dish antenna there, although the wooden
structure surrounding it is failing. Supposedly it was used for
communicating with Tiros. Is that right?

A NJ radio club had a hamfest there in April, and I was able to walk
under the antenna and they have some displays there. Supposedly Camp
Evans was also the place where the first signals were bounced off the
moon, somewhere around 1946.
Camp Evans looks like at least parts of it are being renovated.
Brookdale Comm. College has some classrooms there, very modern.
Oh yes, and on the road leading to Camp Evans (Marconi Road !!) there
is a display of the top portion of one of Marconi's towers, and a
plaque noting that there were many such towers in the area in the
early 1900s.
Quite a bit of radio history, in these parts of New Jersey, and I am
glad to know one of the pioneers frequents this newsgroup.
Not far away, in Holmdel, is where AT&T communicated with Telstar, I
believe, about the same time period. The Holmdel facility, home to
6000 Bell Labs employees as recently as1999 has been sold and is going
to be demolished.

Of course they aren't fascists. What they are is meddlesome groups who find great joy in uniformity and exercising control over a group.

The original intent of such groups was keeping Bubba from parking his '68 Marlin on blocks in the front yard, or using a toilet as a flower planter.

What they have evolved into is a way for nosy people to squawk about anything they don't like and now since somebody somewhere doesn't like everything about anything, you have to get the paint color of your crown molding approved, and can't hang clothes on a wash line in the back yard. You can't plant a veggie garden and the plants you can plant are from an acceptable list.

And yet There is nothing evil in such matters. It's a free country, and if some people feel more comfy by giving up some of that freedom so that

they can get 5 grand more when they sell the place and move into the nursing home - and give the money to said home, then let 'em have at it. There isn't any law against stupid.

Very interesting Walt. Judging by the type of work you were involved in
you must be familiar with the classic text by: Matthaei, Young, and Jones.
I am not familiar with the HP-805, but probably because most of my
earlier lab work was concerned only with HF. I realize that slide rule,
pencil, and Smith Chart was the only way in those days. When I started
work any intense analysis was done in FORTRAN on main frame
computers. One of the hot topics I remember was mini-computers,
but never got to see one. I don't think they lasted long, since soon
after programmable desktops started to become available.

One thing I remember was a guy designing HF antenna tuners, and he
used the Smith Chart. What is interesting is that the charts were
very large, about 2 ft X 3 ft, and came in pads. Much greater
accuracy than the standard chart. I think they may have been published
by a company called K-electronics. I used to needle guys in the lab
by telling them that Smith was a ham.

I now have a nice high res pdf of the Smith Chart, but
usually use an electronic version from
the "Berne Institute of Engineering".

Hi Kris,

Staying inside the apartment has you soaking in noise. You will need
an antenna filter - a cheap, meterless three knob unit will do.

Look into getting it outside, possibly with a downspout. Check into
RG-178, a thin coax that borders on invisible. Put a choke at the end
that sees an ad-hoc dipole.

---------- REPLY SEPARATOR ----------

At the time I lived in the Seattle area so waterproofing was a must. I built a plywood box with a plexiglas front and sealed it with silicone. I used it for a couple of years and never had to clean the roller inductor. One thing I didn't mention but should have is to have most of the loading inductance in a separate high Q coil, and use the roller only for tuning. IOW, don't try to use the roller for the entire loading coil or it will tune too fast and probably won't be very high Q either. As with mobile antennas, a center coil is best, or at least as high off the ground as practical. If you don't have an MFJ SWR analyzer or the equivalent, buy or borrow one. I would not attempt this kind of project without one!

The motor was one I got from All Electronics in California. They seem to have lots of surplus ones available. Something around five RPM would be about right. They call them "gearhead" or something like that because they have the reduction gears built in.

Does that answer your questions?

1639. Question on carbon fibre fishing rod

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-02 17:32:38 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <44d0e1b6$0$35077$4fafbaef@reader4.news.tin.it>
Source record: 55226

I plan to use a carbon fibre fishing rod as a stealth antenna at my summer QTH . The rod would just be a mechanical support, while the proper antenna would consist of a copper wire replacing the fishing wire (i.e. it would run on one side of the rod, parallel to it)

I am getting worried by the fact that the carbon fibre rod may dissipate significant power because of the RF current induced in it (the rod would be very close to the radiating wire) and of its non-negligible resistance.

I had occasion to broadly measure the rod DC resistance with an ohm x 1000 ohmeter, at about 4 inches of distance on the rod, and the meter reading was about full scale (low resistance). But the resistance range I am worried about is in the order of a few ohms, so my measurement does not tell much. In any case, reading some articles on carbon fibre on the Internet, I learned that the rod must anyway have a few ohms of resistance, quite a dangerous range.

The real question is: shall I expect that the copper wire will induce RF current on the rod that would cause power dissipation in it? Does anyone have experience with such an arrangement?

Please do not suggest me to use a fiberglass rod instead because, for a given length, it would be much thicker and heavier (too much).

==========

Frank,

Thank you for the above.

Can you do 36 radials from 0.6 to 8.0 metres in increments of 0.2 metres?

Must be the same input data as before :- F = 8.07 MHz, Ground = 150,16 Radial diameter = 1.64mm, Depth = 25mm.

Reg.

1642. Re: Radiating Efficiency

Source record: 55229

Reg,

I have taken Frank's numbers from NEC-4 (that he sent me) and compared the results with Radials_3. Here is what I found:

NEC-4 Parameters (in parens are the values I get with Radials_3, note the differences are LARGE)

Height 20 m;
Radials 15 m;
24 radials at 15 degree intervals;
Radials 25 mm below ground;
All wires # 14 AWG copper; (I USED 2mm wire)
Gnd. Er = 25, Resistivity 25 ohm-m;
Resonant Frequency 3.64 MHz, and; (Radial_3 shows Resonant Freq of 3.750)
Zin = 41.32 + j 0.156466 ohms at 3.64 MHz. (34.17 ohms and j -24.6)

If I change the Freq in Radial_3 to 3.750, I get Zin = 37.41 and j -0.0.

That is 110 KHz difference for the same antenna and ground characteristics. Not very good agreement.
==========
Now, on to the real question I have been asking for a week: Does the current along the radials fall off as rapidly as Radial_3 predicts? I used the numbers from the above antenna, (supplied by Frank from NEC-4) and compared them to what Radial_3 says for the same length. I do not have numbers showing a 5 meter radial for NEC-4 and a 5 meter radial for Radial_3. What I am presenting is the current along the full radial in NEC-4, vs. the current in a radial of specified length in Radial_3. Length is in meters.

Since we are using ratios, I only used the integer and two decimal places for the current in my calculations. All values for current are actually what is presented * 10^-2

Length Current NEC-4 (dB) Radial_3 (dB)

0 9.15 N/A N/A
1 8.37 0.77 6.2
2 6.98 2.35 12.4
3 5.63 4.22 18.6
4 4.55 6.07 24.7
5 3.57 8.17 30.9
6 3.00 9.69 37.1
7 2.54 11.13 43.3
8 2.16 12.54 49.5
9 1.84 13.93 55.7
10 1.60 15.15 61.8

11 1.46 15.94 68.0
12 1.41 16.24 74.2
13 1.36 16.56 80.4
14 1.04 18.89 86.6
14.75 0.26 30.93 91.2

Notice at a lenght of 4 meters, Radial_3 is showing 24.7 dB of attenuation of the current, while NEC-4 is only showing 6 dB...not even close.

Notice throughout the lengths from 3 to 11 meters, the difference between Radial_3 nd NEC-4 is a pretty consistent 4X, i.e, Radial_3 is showing four times the attenuation at a given length that NEC-4 is showing. Patterns like this in data are rarely the result of chance. Maybe this will lead to a resolution of the problem.

If Reg's threshold of 25 dB attenuation is reasonable (at which point adding additional length is of very little value), then NEC-4 says for this particular set of variables that we don't attain anything near 25 dB current attenuation along the length until we get to greater than 14 meters (and the wire is only 15 meters long!)

How could the current in a 4 meter radial drop by 25 dB within its length?

So, I'm left with two questions:

1. Extra wire....what extra wire? It looks like one needs the entire 15 meter radial wire, not some 4 meter stubby....at least according to NEC-4.

2. Why such a discrepancy in resonant freq between NEC-4 and Radial_3?

Unless someone else can point out an error in the analysis, it appears that the transmission line model that Reg is using to predict rate of current drop along the radial vs. length is either the wrong model, or the wrong application thereof. NEC-4 just doesn't seem to support the rapid current fall-off that Radial_3 predicts.

BL&E says it ain't so.
Tom, W8JI, says his measurements say it ain't so.
NEC-4 appears to say "it ain't so".

If I were a betting person, I'd say it ain't so.

Back to the drawing board?

In the mean time, anyone putting in a radial field woud appear to be better served by the references in this thread to "optimizing radial systems", I think by K3LC...it's in several antenna books.

73,

p.s. How all this fits into efficiency someone else can analyze, but it can't be good.

...hasan, N0AN

Hi Tony,

Presuming a length of 3M, and you can tune the antenna; then you may
lose a few dB.

As for heating. The exposure to sun (if the rod is black) will
probably create more heat than the RF. You need to provide a
resistance reading with more resolution than 0 Ohms on the 1000 Ohms
range.

1646. Rule of Thumb for coax chokes

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-02 19:17:17 UTC
From: Cecil Moore <mycall@hotmail.com>
Message-ID: <1T6Ag.1806$kO3.783@newssvr12.news.prodigy.com>
Source record: 55233

Based on some calculations I did today, I am offering
an original rule of thumb (as far as I know). Regarding
a coax choke, when deciding how many turns of coax to put
on a 2 liter pop bottle at two turns per inch, one needs
to avoid the self-resonant frequency. So don't put more
turns on the choke than the number of meters in a wavelength,
e.g. no more than 20 turns on 20m, no more than 6 turns on
6m. Backup calculations will be published on my web page.

---------- REPLY SEPARATOR ----------

The only way to know for sure is to try it. Give it a few watts for a few seconds and feel for heat. If there is any at all, go to plan B.

If there is no heat, give it 100 watts for a few seconds. Still no heat? Give it full power for a longer period. Still no heat? You have your answer.

If you can measure the resistance at more than one point on the surface of the rod, does this imply that the rod surface is conductive everywhere along its length?

If you could attach the wire to the rod so that it touches everywhere along the length, then the current would divide between the rod and the wire according to their respective resistance per length (most of the current would flow in the wire) and the currents induced in the pole would be in phase with the currents induced in the wire.

I think it would help to have the wire attached at least at the bottom of the pole and the top of the pole.

If you attach the wire only at the top and ground the bottom of the pole, you make a rather lossy folded monopole. If you attach the wire at both the top and bottom of the pole and insulate the whole structure from ground, it's more like a cage monopople with one lossy wire and one good wire.

Hi Tony,

That is the only sure way of knowing. Modeling with EZNEC will
certainly reveal obvious problems.

>> As for heating. The exposure to sun (if the rod is black) will

Same thing.

>There are many articles on the Internet that suggest a resistance in the order of one ohm or so. But knowing precisely how many ohms the rod shows woud not help much, as, again, until the loss mechanism is not characterized, noone can stell something sensible

Total resistance over 8 meters is 1 Ohm? If so, it does not look like
a problem. 1 Ohm every 10cM? Still does not look like a problem.

Download EZNEC and do your own modeling.

Richard,

Can you assign different conductivities to different wires in EZNEC? I don't think you can.

You could distribute the resistance, 1 load per segment each having a resistance of 1/#segments of the total. It seems important for coupling to have a realistic diameter (fat) wire for the carbon fiber pole, but it needs to be lossy.

A load taper from bottom (large tubing, lower resistance) to top (small tubing, high resistance) would be easy to implement as well. This is probably only worth it if it seems that the loss will be nonnegligible, but it could take into account the effect of the element current distribution on loss.

Hi Dan

> If you can measure the resistance at more than one point on the surface
> of the rod, does this imply that the rod surface is conductive
> everywhere along its length?

I am not sure having fully understood your remark. I presume that, the materal being homogeneous, the rod surface is conductive everywhere the same way. The various elements of the rod touch each other, so there is electrical continuity along the whole rod. Clearly, toward the rod top, resistance will be higher due to the thinner diameter

> If you could attach the wire to the rod so that it touches everywhere
> along the length, then the current would divide between the rod and the

> current would flow in the wire) and the currents induced in the pole
> would be in phase with the currents induced in the wire.

I agree that currents would divide between the rod and the wire according to their respective resistance, but this is not my main worry as the very low-resistance copper wire would nearly fully bypass the rod resistance. What I am instead worried about is that, the rod being thick, the RF current may not be the same along the rod circumference. In other words, at the point of contact between the rod and the copper wire, the rod current could be lower than that at its opposite side. Such extra current could develop due to the rod electromagnetic coupling with the radiating wire. However, I am not sure whether my reasoning makes real sense

>
> I think it would help to have the wire attached at least at the bottom

My idea is to have the wire attached at both the bottom and the top of the rod as you suggest. The bottom copper lead would also be connected to the center conductor of the coaxial feed cable (the cable braid would instead be connected to the radial system).

Now an interesting case. Suppose that the copper wire is instead kept fully insulated from the rod (though very close to it). Would you expect power loss to occur in the conductive rod due to RF currents flowing through the rod due to its electromagnetic coupling with the radiating wire?

Well, one ohm is just the order of magnitude. It will be neither one tenth of a ohm, nor 10 ohms. Moreover resistance will vary along the rod due to the very significant diameter change, and RF current is not constant along the rod either. I am beginning to fear that the only way to really understand how things go is to buy the rod, build the antenna, apply high power (> 1kW) to it for 15 minutes, and the touch the rod to determine whether its temperature has raised somewhat.

Tony,

The best thing to do is insulate the wire from the rod at the top and bottom. Space the wire from the rod by one or two centimetres.

The rod will not be near to 1/2-wave resonance and the antenna will behave very much as if the rod did not exist.

Remember that loss induced in the rod will be negligible when the resistivity of the rod is high, or is also very low. I would imagine the loss would be greatest when the end-to-end rod resistance is in the order of 150 ohms.

But loss will be induced in the rod only when the rod is near to 1/2-wave resonant.

Reg.

Canada is a perfectly wonderful place.

The original posting title "Democrat's Out-Sourcing 'Hate America' To Canada !" sounds like it is right out of the Colbert Report.

In America today, to be fiscally conservative, one cannot be a Republican. What's the deficit today? 3 trillion? 9 trillion? Who gets a tax cut? the middle class? not lately.

Praise the Lord and pass the exemptions.

> 73, Cecil http://www.qsl.net/w5dxp
==========

But Cecil, maximum resistance, maximum reactance and maximum impedance
all occur at the same resonant frequency.

And at the resonant frequency minimum loss occurs in the choke anyway.
There's negligible loss of power in the choke left to save.

Antonio,

The carbon fiber rod is very thin with respect to a wavelength. There won't be any significant of the RF current variation around the circumference of the rod.

If you have the wire insulated from, but closely spaced to the carbon rod. Then the rod becomes a parasitic element ONLY coupled to the wire via the fields. If the rod is insulated from ground by a base insulator there is probably no problem. I think the current will still divide approximately the same way. There may be some subtle differences.

The situation where you allow the rod to touch the ground (or worse, the ground radial system) is drastically different. Now you have, instead of a monopole, a weird parallel transmission line. A closed top gives a folded monopole, but opening the top (insulating the wire from the pole everywhere) doesn't change the fact that it's a transmission line.

Imagine the following: the top is open, you're operating on 30m where the pole and wire are very close to 1/4 wavelength long. This gives a very *low* impedance at the bottom of your open transmission line stub. I think a great deal of differential mode current could flow in this case, and I think it would cause a good amount of loss.

I think your plan of having the wire connected to the pole at top and bottom is sufficient if you have a good base insulator.

Dan

P.S. I wondered about the surface of the rod because I thought perhaps there would be an outer nonconductive layer of thin plastic film to protect from carbon fiber splinters. If there's no such film, then spiralling the wire around the pole or clamping it periodically to the pole will make for good contact everywhere.

In calm air, what's the temperature rise you'd expect for a tolerable
(1dB?) amount of loss with 1kW input power?

Incidentally, I don't think you'll run out of ham radio uses for an 8m
carbon fiber rod, so I'd just buy it and build. I think I want one
now, too ;-)

Think the old fashioned method of getting away from the coastal area was to carry an oar over one shoulder and hike 'til someone asked, "Whats that thing on your shoulder?" Can't say personally, I've always lived near Americas heartland (Used to be called the Great American Desert before they found it was a wheat growers paradise).

>Rick K2XT

Hi Rick,

Thanks for the response to my post.

The first eight versions of TIROS were shaped as a short 18-sided cylinder about 30 inches in diameter and about two feet tall. It contained a 1/2 inch vidicon video camera and an infra red (IR) sensor. Direct viewing of both the camera and

IR sensor was attained whenever the spacecraft was within sighting distance of the three ground stations, one at Ft. Monmouth, NJ, one at our RCA Space Center at Hightstown, NJ, (where we built the spacecraft) which I operated, and one in Australia.

There were also two tape recorders that recorded the video and IR when over other places on Earth out of range of the ground stations, for playback when in range.

The video and IR transmitters each delivered 5 watts, the video on 235 MHz and the IR on 237.8 MHz. There were two beacon and telemetry transmitters, one on 108 MHz and the other on 108.03 MHz, each delivering 30 milliwatts. Beginning with TIROS 3 and on through 8, the beacon-telemetry transmitter frequencies were changed to 136.0 and 136.5 MHz, leaving the 108 MHz frequencies free for aircraft communications.

The monopole antennas were sleeve type. A half-inch sleeve 1/4 wl long at 236 MHz radiated the video and IR signals, and a rod extension, along with the sleeve, radiated the 108 MHz signals. The internal portion of the sleeve formed a quarter-wave shorted transmission line that decoupled the rod extension at the 235 and 237.8 MHz frequencies, as part of the frequency-separation circuitry that allowed the antenna to operate on the two frequency bands separated by approximately an octave.

I have a number of pictures of the spacecraft in various views in JPG format that I'll send to you as soon as I can get them together.

Now concering Camp Evans, I'm not sure that that was the location of the TIROS dish, which was 28 feet in diameter. All I can recall after all these years is that the dish was at Ft. Monmouth, the location of USASRDL, the Signal Corps Development Laboratory. Camp Evans might have been on the Ft. Monmouth Army Base, but I just can't remember.

I knew several of the engineering guys at Bell Labs Holmdel, but all I knew there have passed on.

Hope this helps,

Walt, W2DU

Interestingly, my wife is also a Canadian, she moved down here to the US
just before we got married. She worked only part time in Canada.
Aparantly, the health care is NOT universal, as many meds she needed she
had to pay for out of her own pocket, and had to wait months for an MRI
(She just had one here on one weeks notice). Yup, there are issues here
too, but the Canadian system is far from perfect either.

This is a riddle, right?

If you are after a few pF, then the losses in the stub will be very
low, but at lower reactances, the resistance or loss element becomes
more significant.

So you have hinted a bit at this loop.... lets do some guessing:

An inductor of 1.5m square and 20mm conductor diameter has an
inductance around 5uH, thats about 140 ohms at 4.45MHz... so it looks
like your tuning capacitor is 250pF.

You probably need around 400pF at 3.5MHz, so lets add another 200pF in
shunt from an RG213 o/c stub. You need an admittance of ????+j0.0044
S.

Using the line loss calculator at http://www.vk1od.net/tl/tllce.php ,
it looks like 1.95m of RG213 terminated with 1e8+j0 will have an input
admittance of 0.000004+j0.004401. So this stub is dropping around
4e-6S of loss conductance across the loop, or 250kOhms in shunt if you
like. This shunt resistance is somewhat lower than you would expect
with a good quality capacitor.

You can estimate the effect by plugging the 250KOhms resistance into
your design model and examining the change in efficiency.

==========
Lee,

You will need at least 70 percent more capacitance.

But where you'll find that much, high voltage, high Q capacitance is
anybody's guess. You would do better to fit a larger variable
capacitor designed for the job. Or make a larger loop.

A lumped capacitor made from coax cable is low Q anyway because of the
small diameter of the inner conductor. Compare coax inner conductor
diameter with loop conductor diameter.

Download program MAGLOOP4 from website below to give you some ideas.

There are delays I will admit that. Universal means that everyone can
participate it, it does not mean that it covers everything. I also have
private insurance to cover drugs, dentistry, the surcharge for private
hosptital rooms etc. I guess that I got really ticked off when the guy
said that hospitals routinely close because they run out of money, that
was bull and it really ticked me off. Please excuse my sensitivity.

Reg, if you would learn the Smith Chart, you would know
that is not true. :-) At self-resonance, the inductive
reactance cancels the capacitive reactance leaving a
pure resistance usually of a few thousand ohms. But I
agree with you that a purely resistive self-resonant
choke is not a bad thing.

==========

Cec, I don't need a Smith Chart, and neither does anybody else, to
work out the resistance at resonance.

I don't think you quite know what you are doing with elementary
circuit analysis. The Smith Chart is giving you the wrong answer. The
resistance of a choke at HF at self resonance is in the order of a
megohm or more, not just a few thousand ohms.

By the way, what is the diameter and winding length of a USA pop
bottle.

Reg.

Heh!....too technical for me i`m afraid Owen....Heh heh..... :-)

I`m using a tuned RG213 stub about 2meters long as a temporary measure for 80, till i can sort the cap problem..... i just need a simple answer is all.....

Thanks.....

Lee.....G6ZSG.....

1686. Re: Radiating Efficiency

> metres?
>
> Must be the same input data as before :- F = 8.07 MHz, Ground =
> 150,16 Radial diameter = 1.64mm, Depth = 25mm.

Reg,

Here are the results from the analysis of a 26 radial system.
All dimensions and parameters are the same as for the single
radial antenna as you defined above:

0.6 m -- Radial Z = 37.3 - j 28.1 -- Efficiency 15%
0.8 m -- Radial Z = 30.5 - j 21.0
1.0 m -- Radial Z = 26.2 - j 16.9
1.2 m -- Radial Z = 23.2 - j 14.2
1.4 m -- Radial Z = 20.9 - j 12.4
1.6 m -- Radial Z = 19.1 - j 11.1
1.8 m -- Radial Z = 17.6 - j 10.1 -- Efficiency 21.0%
2.0 m -- Radial Z = 16.2 - j 9.4
2.2 m -- Radial Z = 15.1 - j 8.8
2.4 m -- Radial Z = 14.0 - j 8.4
2.6 m -- Radial Z = 13.0 - j 8.0
2.8 m -- Radial Z = 12.1 - j 7.7
3.0 m -- Radial Z = 11.3 - j 7.4
3.2 m -- Radial Z = 10.4 - j 7.1 -- Efficiency 24.5%
3.4 m -- Radial Z = 9.7 - j 6.8
3.6 m -- Radial Z = 8.9 - j 6.5
3.8 m -- Radial Z = 8.2 - j 6.2
4.0 m -- Radial Z = 7.5 - j 5.8
4.2 m -- Radial Z = 6.9 - j 5.5
4.4 m -- Radial Z = 6.4 - j 5.1
4.6 m -- Radial Z = 5.8 - j 4.7
4.8 m -- Radial Z = 5.4 - j 4.3
5.0 m -- Radial Z = 5.0 - j 3.9 -- Efficiency 27.8%
5.2 m -- Radial Z = 4.6 - j 3.5
5.4 m -- Radial Z = 4.3 - j 3.1
5.6 m -- Radial Z = 4.0 - j 2.7
5.8 m -- Radial Z = 3.7 - j 2.3
6.0 m -- Radial Z = 3.5 - j 2.0
6.2 m -- Radial Z = 3.3 - j 1.6

6.4 m -- Radial Z = 3.1 - j 1.3
6.6 m -- Radial Z = 3.0 - j 0.9
6.8 m -- Radial Z = 2.9 - j 0.6
7.0 m -- Radial Z = 2.8 - j 0.3
7.2 m -- Radial Z = 2.7 + j 0.01
7.4 m -- Radial Z = 2.6 + j 0.3
7.6 m -- Radial Z = 2.6 + j 0.6
7.8 m -- Radial Z = 2.6 + j 0.9
8.0 m -- Radial Z = 2.5 + j 1.1 -- Efficiency 31.1%
.
.
10.0 m -- Radial Z = 3.0 + j 3.3 -- Efficiency 32.6%

Where I have shown the efficiency as sky wave power out. The input impedance is that of all radials, so for a single radial the input Zr must be Ztr * 26.

Frank

My thoughts also on both likely answers Reg but the cap is a foot long 4 inch sq 12/14kv 26 rotary vanes, now 28 as i`ve added (squeezed) two more rotaty vanes and four stators into the frame (came in kit form), also designed the loop using loopcalc program which gives 407pf at 3.5megs...my cap is supposed to be 500pf !!......

Well, my guess from you data is you will need about 2m of RG213, and
you will find that it "works", but it doesn't work as well as a low
loss capacitor.

OK, fair enough.

The Amateur Radio Service of the 21st century will be all CW without a
Morse Code Exam.

We'll go out of existance EXACTLY like we came in.

I'm sure that will make the Morseodists happy.

Before publishing your rules of thumb you can check your reasoning by
using program SELFRES3. Download from website below.

I must admit, rules of thumb are quite adequate for coaxial chokes.
Almost anything will work. Very often things will work quite well
without a choke at all. ;o)

I used radios in the military. I never used a CW key in the military.
I never jammed another operator, although Brandywine asked me to reduce
power once.

> >> >how patriotic is it to keep a staion forom aquiing the skill to be

We self-train. It is a continuous process of improvements. You
mistakenly believe that at the conclusion of The Exam, the "operator"
is 100%.

Never was, Never will be, and neither were you weren't.

I'm beginning to think that you're from the school of "The Older I Get,
The Better I Was!"

> >> Or any skill, other than

Nor do you.

> But that's what Mark and his ilk want - we'll have "skilled operators"
> if we allow people to buy radios and put them on the air with no skill
> or knowledge. By osmosis? Or by magic?

I've listened to emergency responders on a scanner before. They don't use Morse Code, they don't use CW. They use FM/Voice. Somehow they are effective at it, not having taken a Morse Code test. How can this be?

Tell you what. The next time your YL dials 911 for you, she has to communicate with the 911 Operator in Morse Code. She can just sound it out with her mouth, no keyer, sounder, clacker or anything else required.

When the Operator tells her to speak normally, your YL is allowed to say once, and only once, using her normal voice, "Real communications takes place with Morse Code" and then revert back to sounding out her message with Morse Code dits and dahs.

Agreed?

On your block of granite, she will say, "Here Lays Al Klein, Who had no use for Voice Modes. May He Rest In Peace"

> >> And you, particularly, don't acquire
> >> knowledge by demanding something for nothing.

> of us who don't think lack of instant gratification is the worst thing
> in the world.

Dial 911 and tell the operator that you don't need instant gratification, take your time.

> What next? DXCC awards for those who *want* to work 100 countries?

You seem to be confused. DXCC is an award offered by the ARRL, not the FCC. It has nothing to do with licensing.

You ask "What next?" How about a test for everyone else except you, where you get to try to recall what was on your test, but can't.

Antonio,

My intuition about the rod and wire in parallel appears to be incorrect unless the resistance of the rod is quite low, at least on 7MHz. My EZNEC model shows that the wires in parallel give substantial loss (up to a couple of dB or so lost in the resistance of the rod) with the wire connected at the top and bottom and the total rod resistance in the 1-10 ohm range.

Separated and insulated from the rod seems to work quite well on 7MHz. However, if the rod is connected directly to the ground radials a large amount of loss is introduced. (I got 5dB in some cases with fairly high resistance)

I have found other frequencies where the loss is more than a dB or so even in this configuration (18MHz is near a halfwave resonance, which is problematic, as Reg has correctly surmised).

The model shows that the current distribution on the lossy element is occasionally complicated and bears further investigation. I've posted the model I put together online. It's in some random configuration of frequency, load resistance, and connectedness of the lossy rod to ground, I don't know where it was when I saved it:

http://www.n3ox.net/projects/eznec/carbonpole.ez

It has too many segments for the free version but it probably bears more investigation ... it is possible for the setup to be quite lossy on some frequencies. I think Reg's comment about halfwave resonance and intermediate resistances between very low and very high was quite accurate, as was mine about quarterwave resonance and connection to the groundplane.

Reg, I meant 36 radials. The 26 is a typo.

Tony, what happens if you load the transmitter into the rod, directly? Upon reading that the end-to-end resistance of the pole may be about an ohm, that idea was in my head instantly. Impedance to RF is a different animal, of course but I would try it on low power, just to measure SWR. And you don't have to do anything, really, to determine whether you can _hear_ using it!

I hope you keep us informed.

Not actually. On a clear day, I can see the Pacific Ocean from my yard and we have no HOA and no antenna restrictions in the CC&R's. My area was developed in 1968 and the CC&R's are up for renewal in a few years. I need to pay attention to that event. I might lose the right to put up more antennas and be "grandfathered" for only what I have now.

==========

Frank,

The input impedance of 26 radials is NOT equal to all 26 connected in parallel. There is a non-linear relationship between the number N and input impedance because they share the same volume of soil at least when they are short.

For 26 radials the resonant effects have disappeared which I cannot explain. Yet attenuation is the same, Zo converges on Zin at approximately 8 or 10 metres as before.

You appear to have automated the results. Can you do a large number of radials, say around 100, from 0.4 to 8.0 metres?

And can you do a small number of radials such as 6 or 8, from 0.4 to 8.0 metres?

Lee,

You can greatly increase the Q of a long length of coax cable by
cutting it into 7 equal short lengths.

Then put six lengths round one length and connect all seven in
parallel. In theory, this increases Q by 7*7 = 49 times for the same
capacitance. And it occupies less space. But when outdoors it is
more difficult to seal against the weather.

Reg, G4FGQ

Wouldn't the resonant circulating currents be at their
highest magnitudes at the parallel resonant point and
therefore the I^2*R losses in the coil be greater at
that frequency than on either side of self-resonance?
(I explained that avoiding self resonance is only a
personal preference.)

>> correct answers denies all privs - HF, VHF, UHF ...

>There is no pass/fail practical for SSB, FM, AM, FSTV, SSTV, RTTY, FAX,
>Packet, PSK, etc, etc, etc.

There's no test at all, so those claiming that the reason they want a
test for CW dropped because it's not "modern" have no argument - they
want no test for FSTV, SSTV, RTTY (which is also pretty old hat),
packet, PSK, etc. They want no test at all, unless they can memorize
a few answers to "pass" it.

>> >> >How progressive is it?

>> >> How progressive is it to not require people to know ... oh, yeah,

>> >Then why is it with the prospect of losing the CW Exam, that you'se
>> >guys want to "beef up" the written exams?

>> We don't.

>That is not true.

Sure it is. "Beefing up" the written exam is a counter to "drop CW
because it's old fashioned". If you want modern you want the testing
to be turned from CW to modern modes. Those who want CW dropped just
want what they can't memorize dropped so they can get a ticket without
really being tested on anything. Actually knowing anything is so old
fashioned, isn't it?

>> We want to get back the level it used to be before it was
>> dumbed down to the point that you could almost pass it if you never
>> heard of the FCC, ham radio or electronics.

>You're referring to the Conditional license, right?

No, I'm not addressing *where* the test is held at all - I'm addressing *whether* there's any real test, which there isn't, except for CW right now. Spitting out something you memorized is only a test of memory.

>> Just by guessing at the
>> answers. It used to require that you draw (was it 3?) schematics.

>You tell me? Was it 2 or was it 3?

I don't remember after almost 50 years - but I could still draw them today, and it's not a test of remembering what's on the test, it's a test of knowing what's in a radio.

>> From scratch. Let's see how many people could do that today. A
>> Colpitts oscillator, a Hartley oscillator and some other circuit that
>> I've forgotten at the moment.

>You should self-modify your license and cease amateur operation until
>you remember.

Why? Testing isn't about memory, it's about knowledge.

>The amateur is self-policing, and you no longer meet your own standard.

Sure I do. The test wasn't to remember what circuits to draw, it was to draw them. And I can draw them any time.

>> They're still as relevant today as they were 50 years ago.

>Other things are relevant today that weren't even known 50 years ago.

So let's have them on the test.

Oops, that's right - no more relevant testing, isn't that what people are asking for? Just give me the answers so I can memorize them and pick them out on the test.

>> >> >how loyal is it to denny the nation the benifits of allowing more
>> >> >operators

>> >> What "benefits" does the country get from more people using radios who
>> >> don't know the first thing about them? (Whatever "denny" means.)

>> >It's always been that way. You could even buy Heathkits already
>> >assembled.

>> But you had to actually *know* a little theory to use one legally.

>No you didn't.

Yes, you did - you had to pass a test to show that you did. All you have to do now is memorize a few answers.

>I used radios in the military. I never used a CW key in the military.
>I never jammed another operator, although Brandywine asked me to reduce
>power once.

But you had to learn how to use the radios. Hams today don't - they
memorize a few answers, buy equipment and get on the air - with no
understanding of what they're doing, and no desire to learn.

>> That's exactly what he's talking about. Give someone a radio and a
>> "license" to use it and he'll "acquire the skill to be ready for
>> service to country and community". That's what Mark said, right up
>> above. How does one acquire skill by playing radio?

>We self-train.

You may, but I can see from many of the comments that have been posted
here that a lot of people don't. They don't want to learn, they want
to get on the air. Period.

> It is a continuous process of improvements. You
>mistakenly believe that at the conclusion of The Exam, the "operator"
>is 100%.

And you mistakenly believe that most hams today want to learn how to
operate properly. Listen to 75 some evenings.

>> But that's what Mark and his ilk want - we'll have "skilled operators"
>> if we allow people to buy radios and put them on the air with no skill
>> or knowledge. By osmosis? Or by magic?

>be?

They were trained.

>> So you'd get a license not knowing CW, build a radio (you couldn't buy
>> one then) and ... what? Sit and look at it. Some things are just too
>> obvious to need mentioning.

>Please diagram that radio from "Scratch."

Any time. Filter or phasing? BFO receive or quadrature detection?
I've designed them, built them and used them, and still could.

>> Evidently not, or I'd be the only one in the world advocating that a
>> test should actually test for something. There are actually millions
>> of us who don't think lack of instant gratification is the worst thing
>> in the world.

>Dial 911 and tell the operator that you don't need instant
>gratification, take your time.

Very bad example of an attempt at sarcasm and a misunderstanding of
"gratification".

>> What next? DXCC awards for those who *want* to work 100 countries?

>You seem to be confused. DXCC is an award offered by the ARRL, not the
>FCC. It has nothing to do with licensing.

But an award for wanting has to do with "I want it so it's my right to
have it", which is what I'm talking about. No one has any "right" to
get on the air.

Probably not carbon fiber tho, right?

I doubt it's possible to make a carbon fiber pole without end-to-end DC continuity. It could be high resistance, but I think you're always going to have fiber-to-fiber contact along the whole length of the pole.

Carbon fiber, just as a point of general information in this thread, seems to have about 800 times the resistivity of copper according to matweb.com, and about 20 times the resisivity of 304 stainless steel. Not something that will make for a great radiator.

If you assume fairly low frequency such that the skin depth in carbon fiber is deep enough that current will flow uniformly in a 1.6mm (1/16 inch) tube wall, and uniformly in a 1mm wire, you need a 10cm (4 inch) carbon fiber tube to match the 1mm wire in conductor loss!

Interestingly enough, I read recently (I don't remember if it was QST or on the web) about someone who was using a fiberglass fishing pole for a vertical antenna and had significant detuning problems until they moved the wire far away from the pole. I, on the other hand, built a center loaded 40m antenna on a pair of fiberglass poles and it tuned exactly as one of Reg's programs and EZNEC said it would, suggesting that my poles are fairly good insulators.

I still think I'd like a carbon fiber fishing rod... sounds nice and strong. Maybe it's best used as center supports for inverted vees and the like, and for carefully considered vertical applications.

Probably, Cecil, since it would then make it difficult to pass the
test.

"I"

There. You just got ONE "character" of several
electronics-related formulas.

Now do something with it without knowing the rest of the
"characters" that go with it.

So true. We get 100 degrees a lot but the humidity is usually no more
than about 25% and is often lower. It's quite nice, really, until the
brush fires begin. :-)

You missed the point. The Morse code skill exam requires
memorizing the characters. Memorizing is being condemned
as an evil act. Since memorizing is evil, the Morse code
skill exam should be the first thing to be eliminated.

The self-resonance to be avoided is 1/2WL self-resonance,
e.g. 20 turns on 10m. I apologize for confusing the two
self-resonant concepts.

Hi Cecil

Doesnt the increase of impedance of the parallel resonant "balun"
discourage current from flowing into it? I considered that the source
impedance is constant and the "balun" impedance rises as resonance is
approached.
I figured the circulating current would be Q times the current thru it,
but the current thru it drops as its impedance rises.

If I'm wrong, I've been lucky so far.

Jerry

In some cases, it "could" be said that hairs are being split. To have "knowledge" of the code - could mean basically - you know it exists and why it is used. To "know" the Morse Code, usually refers to KNOWING the characters sufficiently to use them at whatever speed it is you can. On the other hand, someone who isn't involved could say - that a Ham operator is "knowledgable" in the code. Heck, to someone not IN Ham radio - they could easily assume a NO CODE tech - KNOWS code.

Memory plays a big part be it with learning CODE OR Electronics formulas. MEMORY plays a huge part in "remembering" how to solder correctly and so on. You have to MEMORIZE these things just like code characters - to be proficient. Just like MEMORIZING traffic signs and so on - to get your license to drive.
I think there is too big a deal being made here.

It comes down to - if you want to do ANYTHING - be it do morse code, drive, parachuting, whatever - you have to MEMORIZE SOMETHING - to make it happen.

==========
Hi Cec,

The exceedingly small power loss in the choke depends on the impedance of the power source which is driving it. It is a question of non-conjugate mis-matching. But at self-resonance, and indeed anywhere else, you can forget all about power loss. Especially as no ferrite material is involved.

If you have bothered to check your "rule-of-thumb" and "turns-per-metre-of-wavelength" against program SELFRES3, then, provided results are in the same ball-park, all will be more than satisfactory. SELFRES3 is itself only approximate. The choke's self-resonant frequency is somewhat indeterminate as soon as anything is connected to it.

A hank of a bunched number of turns is quite good enough as a coaxial choke. It is only necessary to know the number of turns and the diameter. Construction neatness helps with estimating the number of turns but has hardly any effect on performance.

Coaxial chokes are a relatively unimportant circuit component. Exactly what they are supposed to do is aways doubtful unless they are used as baluns. I wonder why I am spending so much time discussing the subject. Praps it's because I have nothing better to do.

Just to clarify my point - many "assume" a Ham Operator - regardless the
license - KNOWS code. So, if a "No Code" tech simply says "I"M A HAM
OPERATOR" to someone not knowing the license class structure, the
"assumption is made. AND unless that NC tech clarifies it, the unsuspecting
person will go on in ignorance "assuming" ALL hams "know" code. Morse Code
(per my recollection) has always been and most likely - even if only in
history books - always will be known and associated with HAM RADIO.

My bad for confusing 1/4WL self-resonance with 1/2WL
self-resonance. A choke is essentially non-functional
at the 1/2WL self-resonant point. That's the configuration
to be avoided.

I got the 1/4WL and 1/2WL self-resonant points confused
in my mind. A "bunched number of turns" causing 1/2WL
self-resonance would function very poorly as a choke.

> 8.0 metres?

Reg,

I suspected as much concerning the input impedance of a number or radials. Note that my model was 36 radials, not 26. 26 was simply a typo.

Believe me there is no automation involved in running NEC, although the work is trivial. The 36 radial model was taking 13 minutes per run as I approached 8 m length radials. I can certainly model the small number of radials, which should not take too long.

As for 100 radials; this exceeds the maximum number of junctions limit in NEC. This does not mean it cannot be done, there are work-arounds. Due to excessive computer time I will have to develop a model with a more realistic run time. I am interested in doing this for my own benefit, but it will take some time. I will be very busy for the next few weeks, but will be able to squeeze some time in occasionally.

Frank

My mother told me stories of learning morse code this way when she worked for the railroad. She then taught me morse code this way. For twenty yeasrs after that I always wanted to be a ham and finally got m ylicense at about age 35. I was fairly active for about 8 years and pretty much lost interest when my daughter was born. In the last couple of years I have been sporatially interested again but their alaways seems to be little projects and interest that pull me away from it.

When I first went to work at tmy present job almost every tech that worked there was a ham. Just about all of them retired within a few years and nnd only a couple are still active on the ham bands. They pretty much all say that they just dont have time for it anymore. This is where ham radio is going, It is losing out to living.

I havent gotten totally out of it yet and am occasionally involed. Usually working on an antenna project thinking I will become active again. I have been asked to assist some girl scouts in getting badges but I am having a lot of trouble finding scouts that are interested although the requirements are very minimal

Cecil,

A choke consists of an inductance in parallel with its stray capacitance. It has only two terminals.

Its loss can be represented, either by a small resistance in series with the inductance, or a very high resistance in shunt with the inductance and its shunt stray capacitance.

What you mean by 1/4-wave and 1/2-wave resonance I have no idea and, in any case, has nothing to do with how the extremely simple circuit behaves.

The best thing to do is to forget the whole thing and find something else of greater consequence to argue about. <smiley>

While you guys were chewing on this I decided to repair a broken coax on the 80 meter array for beaming europe... Temp 96 degrees... Wind blowing like snot with a storm front coming in and cumulus building to the West and getting ready for a climax... I climb slowly to 100 feet (puffing and sweating.. It can't be cause I'm out of shape! 'Must be the heat', I mutter)...
After a bit of maneuvering, and using one foot to snag a drooping wire I untangle the 70 feet of coax that had flopped back against the tower and managed to wrap itself on everything in sight... I capture the center insulator of the driven element that is waving widly in the wind... After some ten minutes of stripping and clipping and clamping I have the coax reattached... I drag out the propane soldering pencil... I can't keep it lit in the wind... I even resort to lighting it inside my tool pouch.. All I succeed in doing is burning a hole in the pouch... Jeez Louise... I give up and climb down... I left the connected parts taped to the tower leg... I'll have to solder on a calmer day... The saving grace is that I don't have a coaxial choke to deal with...

denny

The circuit is extremely simple only in the human mind, Reg.
It's not so simple in reality. Given a real world choke
wound out of coax, as one increases the frequency of the
signal generator, one will encounter resonances. Some will
look like parallel resonances and some will look like serial
resonances. The first resonance is the 1/4WL self-resonance.

1732. Re: Question on carbon fibre fishing rod

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-03 19:47:08 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <44d252bd$0$35072$4fafbaef@reader4.news.tin.it>
Source record: 55169

I wish to thank all people contributing to understanding the issue.

The discussion confirms me that precisely predicting what happens when using a carbon fibre rod is not easy. On the other hand that rod is so appealing for realizing a stealth antenna leaning on the balcony railing.... Imagine a 27-foot rod, coming down to just 4 feet, weighing just 2 pounds or so, having a diameter of less than 1 inch at the base and about 0.08 inch at the top.... and standing well straight!

So, what I plan to do is the following:
- buy the rod @ about 100$ (it will so also be possible to make more precise resistance measurements than those I can take at the store)
- quickly build a classic 20-meter ground plane test antenna, by extending the rod just as much as needed and taping an insulated copper wire on the rod, parallel to it. I will connect the copper wire only at the rod top and at its base which will be insulated from ground and connected to the coaxial cable center conductor. I will then put four radials on the ground, connected to the coaxial cable braid
- I will apply 1500W RF for some ten minutes. Assuming that the rod causes a loss of just 0.5 dB, this would mean dissipating 163 W on the rod that, considering its low mass, should become hot enough to detect it! Then, if the rod does not get hot at all, I can conclude that no virtually no power gets dissipated in it.
- I will repeat the experiment by keeping the copper wire fully insulated from the rod, though still taped on it
- finally, I will report the test results here.

Hi Sal,

what you suggest is certainly a possibility. But until I do not buy the rod, it is difficult for me to precisely measure the rod resistance and then decide whether using the rod alone makes real sense.

I have finally decided to buy the rod, so I will also try to use it as a radiator, with no copper wire taped on it.

Imagine a 27-foot rod, coming down to just 4 feet, weighing just 2 pounds or so, having a diameter of less than 1 inch at the base and about 0.08 inch at the top.... and standing well straight!

So, what I plan to do is the following:
- buy the rod @ about 100$ (it will so also be possible to make more precise resistance measurements than those I can take at the store)
- quickly build a classic 20-meter ground plane test antenna, by extending the rod just as much as needed and taping an insulated copper wire on the rod, parallel to it. I will connect the copper wire only at the rod top and at its base which will be insulated from ground and connected to the coaxial cable center conductor. I will then put four radials on the ground, connected to the coaxial cable braid
- I will apply 1500W RF for some ten minutes. Assuming that the rod causes a loss of just 0.5 dB, this would mean dissipating 163 W on the rod that, considering its low mass, should become hot enough to detect it! Then, if the rod does not get hot at all, I can conclude that no virtually no power gets dissipated in it.
- I will repeat the experiment by keeping the copper wire fully insulated from the rod, though still taped on it
- finally, I will report the test results here.

Tony,

It's probably worth mentioning, that all of the lossy situations I encountered in EZNEC also caused fairly significant modification of the feedpoint impedance. I suppose it makes sense; this is a necessary condition for coupling significant power into the rod, and could potentially give you extra information beyond just measuring the temperature rise.

73,
Dan

Hi Dan

> If you can measure the resistance at more than one point on the surface
> of the rod, does this imply that the rod surface is conductive
> everywhere along its length?

I am not sure having fully understood your remark. I presume that, the
materal being homogeneous, the rod surface is conductive everywhere the same
way. The various elements of the rod touch each other, so there is
electrical continuity along the whole rod. Clearly, toward the rod top,
resistance will be higher due to the thinner diameter

> If you could attach the wire to the rod so that it touches everywhere
> along the length, then the current would divide between the rod and the
> wire according to their respective resistance per length (most of the
> current would flow in the wire) and the currents induced in the pole
> would be in phase with the currents induced in the wire.

I agree that currents would divide between the rod and the wire according to
their respective resistance, but this is not my main worry as the very
low-resistance copper wire would nearly fully bypass the rod resistance.
What I am instead worried about is that, the rod being thick, the RF current
may not be the same along the rod circumference. In other words, at the
point of contact between the rod and the copper wire, the rod current could
be lower than that at its opposite side. Such extra current could develop
due to the rod electromagnetic coupling with the radiating wire. However, I
am not sure whether my reasoning makes real sense

>
> I think it would help to have the wire attached at least at the bottom
> of the pole and the top of the pole.
> If you attach the wire only at the top and ground the bottom of the

> at both the top and bottom of the pole and insulate the whole structure
> from ground, it's more like a cage monopople with one lossy wire and
> one good wire.

My idea is to have the wire attached at both the bottom and the top of the
rod as you suggest. The bottom copper lead would also be connected to the
center conductor of the coaxial feed cable (the cable braid would instead be
connected to the radial system).

Now an interesting case. Suppose that the copper wire is instead kept fully insulated from the rod (though very close to it). Would you expect power loss to occur in the conductive rod due to RF currents flowing through the rod due to its electromagnetic coupling with the radiating wire?

What I plan to do is to measure SWR in three conditions, i.e. the rod alone (no parallel copper wire), rod + wire connected at the two extremes, and rod insulated from the radiating wire. The measured SWR variation in the three cases will give me an indication of the feedpoint impedance variation, which, as you say, can constitute an indicator of ohmic losses presence.

By means of a tuner, I will be able to deliver the desired amount of RF power into the antenna for quite a wide feedpoint impedance range (and SWR). I can use a short run of coaxial cable to feed the antenna, so the cable loss variation for different SWR values will be negligible on 20 meters.

> any suggestions on a roof mounted thin stainless whip??

Hello!

I was looking into this problem recently too. For the antenna, search on radioshacks website for "102". You'll find their 102" stainless antenna. They have an inventory locator on the website which will tell you which radioshack has it in stock (supposedly). If you have a non corporate radio shack (they're run semi-independent, and have their own stuff as well as radio shack stuff), they're more likely to carry the 102" even if the website says they don't have them. CALL AHEAD, it seems like they just lose their inventory somewhere, and can't find them when it says they have them (How you lose something that's 9 feet long, i have NO idea).

Good luck on a roof mount. I've seen some roofmounts, and I believe some homemade ones. Kinda scary looking. I'm always concerned with the flex on the sheet metal. My nissan truck roof is tooo thin to mount a big whip on without a huge supporting washer (like 8 inches+).

You're not really going to find just a thin metal wire antenna that's not 102". Everything shorter than that is going to have a coil. I also strongly suggest checking out your local truck stop.

Radio shack mostly only sells a ball mount (the one they have supposedly sucks, since it doesn't have the 'teeth' to hold the ball in place well when you attack it, but ball types are one of the strongest!'. They also have mirror mounts. Which are only really useful if you have semi mirrors that are held on by metal poles. Or I guess if you have a roof rack (but then you'd need to get this ground well!).

A compromise that I made is an under hood mount. It's kinda like an L bracket, so you open your hood, and right under the lip (on your car, not the hood) you can screw in the mount, These types allow you to have all the screws hidden below the hood, and the mount sticks up betwteen the hood crack. Then you can run a wire from this, under your hood, and through your firewall (usually you have rubber gromets for other wires already going through your firewall).

The hood mounts are probably not strong enough for a 102" whip.

The other option is magnet mount, with the four 6" magnets. They sell them online for like 30 or 40$. Those will hold anything. Only problem with magnet mounts is that they're more likely to pick up vehicle RFI

noise! I picked up my blower motor for my AC, went away the minute I screwed the antenna into my sheet metal.

Yes. That's understandable. Hams these days don't want to act like hams,
they like to be appliance operators. So kids don't see that CW is
important and fun. All they see is hams gabbing on a microphone like any
CB'er can do.

Cec,

Can't you see that the first resonance corresponds to the parallel resonance of the inductance with its stray capacitance, and is what you call its 1/2-wave resonance?

At your 1/2-wave resonance the input impedance is very high regardless of what the load impedance is on the other side. It does not behave anything like a transmission line.

Higher frequency resonances, IF they exist, will be above and outside the amateur bands and of no interest to anybody.

Interest lies only in either side of the first resonance. That is in the wide band of frequencies at which the impedance is greater than 1000 ohms or so.

See program SELFRES3.

Reg.

That is neet. Now I just got to figure a choke of RG8X at 146mhz to keep the RF from comming back down the outside of the coax cable from the J pole.
The VSWR is realy good at 1:1.1, and it talks realy well.

What about ferrite beads/chokes over the coax instead of the coil of coax cable?

It may just be semantics. I call the first parallel self-
resonant point the *1/4WL* self-resonant point. At its self-
resonant frequency, a mobile loading coil is 1/4WL long. I
am using that same convention for the coax choke. For instance,
my 75m bugcatcher mobile loading coil is self-resonant at
~6.6 MHz. That's the frequency at which it is 1/4 wavelength
long and presents a high impedance. At some higher frequency,
it is 1/2WL long and presents a low impedance.

I didn't say anything about "20 through to 10". Here's what
my rule of thumb says:

No more than 20 turns on 20m, no more than 10 turns on 10m,
and no more than 6 turns on 6m.

My rule of thumb is for RG-213 wrapped around a 4" dia.
2L pop bottle and thus applies mostly to HF. Using a 2"
dia. coil form (pill bottle) with RG8X, my EXCEL
program says 2-3 turns is about right for 2m.

> What about ferrite beads/chokes over the coax instead of the coil of

That works. Just make sure the ferrite is functional at
146 MHz, maybe #67 material.

==========

Cec,

Does all the above apply to the diameter of a pop bottle?

And what is the diameter over the plastic jacket of the coax?

The length of the coil will be N times the jacket diameter, assuming
the N turns are close-spaced.

Don't forget, mean coil diameter will be pop bottle diameter plus coax
jacket diameter. It does make a difference.

Reg.

0.405" for RG-213, approximately 1/2".

> The length of the coil will be N times the jacket diameter, assuming
> the N turns are close-spaced.

Yes, that's why there are 2 turns per inch for RG-213.

> Don't forget, mean coil diameter will be pop bottle diameter plus coax
> jacket diameter. It does make a difference.

Maybe a 10-20% difference. Doesn't make much difference to a
rule of thumb. :-)

How the heck can someone know that the ohm is the unit
of resistance without memorizing it? How can you possibly
develop Ohm's family name from first principles? I
memorized the ARRL License Manual in the early 1950's
in order to obtain my first two amateur radio licenses.
Memorizing license manuals is absolutely nothing new.

I "may" be going out on a limb here but I THINK I may have figured out what Al Klein is speaking of - possibly misrepresenting his line of thinking in the scope of things - thus causing the confusion.

I THINK his idea of memorization or what he is referring to is as such - lets say you have someone who wants to pass their ham exam. They buy a manual and instead of reading the damned thing to LEARN the ins and outs of ham radio, applicable theory, rules, regulations and so on - they simply try to memorize each answer which is shown as the right answer - merely by A, B, C or D. Some clown I knew, tried this - he didn't take into account that the tests were not always in that order - when it came to the answers.

Am I correct Mr. Klein?

Hi Will

I have been using some affordable ferrites for "keeping the RF from the outside of the coax" at about 2 meters. All my crude measurements indicate that the Very affordable ferrite tubes from All Electronics http://www.allelectronics.com/ work OK. I figured the tubes were intended to keep RFI from conducting down the cables inside the *All ferrite tubes*, so I tried them, and they work for me. They have some snap-on models that might have an ID big enough to fit over your RG8X.

The April QST article I liked appeared in about 1973. It was an article on a zero-bandwidth audio filter. The schematic showed a "filter" connected between the hot side of a phone jack to ground, and the bill of materials listed the filter as a precise length of "common copper conductor". I had a Princeton PhD in physics ask me where he could purchase some common copper conductor. He took it fairly well when I pointed out that the article was from an April issue.

That's exactly what I mean. You're misrepresenting "memorizing that
the answer to the question about the resistor with the orange band is
10,000 ohms" is the same as "memorizing the color code".

To paraphrase Maxwell Smart, you're thiiiiis close. Substitute "the
correct answer to each question" for "A, B ..." and you've got it.
Some things have to be memorized - you can't, as Cecil tells us,
derive laws from first principles - but there's a difference between
"the answer to the question about the oscillator is the .001ufd
capacitor" and learning the basics of a Twin-T circuit.

Reg,

Here is the analysis of an 8 radial system. All other parameters
the same:

0.4 m -- Radial Z = 65.4 - j 58.1 -- Efficiency 11.2%
0.6 m -- Radial Z = 48.7 - j 55.4
0.8 m -- Radial Z = 39.8 - j 29.6
1.0 m -- Radial Z = 34.2 - j 23.5
1.2 m -- Radial Z = 30.2 - j 19.2
1.4 m -- Radial Z = 27.2 - j 16.1
1.6 m -- Radial Z = 24.9 - j 13.7
1.8 m -- Radial Z = 23.0 - j 11.7 -- Efficiency 19.4%
2.0 m -- Radial Z = 21.3 - j 10.0
2.2 m -- Radial Z = 19.9 - j 8.5
2.4 m -- Radial Z = 18.7 - j 7.1
2.6 m -- Radial Z = 17.7 - j 5.9
2.8 m -- Radial Z = 16.7 - j 4.6
3.0 m -- Radial Z = 15.9 - j 3.5
3.2 m -- Radial Z = 15.2 - j 2.3 -- Efficiency 22.4%
3.4 m -- Radial Z = 14.7 - j 1.1
3.6 m -- Radial Z = 14.3 + j 0
3.8 m -- Radial Z = 14.0 + j 1.1
4.0 m -- Radial Z = 13.9 + j 2.2 -- Efficiency 23.2%
4.2 m -- Radial Z = 13.9 + j 3.2
4.4 m -- Radial Z = 14.1 + j 4.2
4.6 m -- Radial Z = 14.4 + j 5.0
4.8 m -- Radial Z = 14.7 + j 5.7
5.0 m -- Radial Z = 15.2 + j 6.3 -- Efficiency 23.0%
5.2 m -- Radial Z = 15.6 + j 6.7

5.4 m -- Radial Z = 16.1 + j 7.1
5.6 m -- Radial Z = 16.5 + j 7.3
5.8 m -- Radial Z = 16.9 + j 7.4
6.0 m -- Radial Z = 17.2 + j 7.5
6.2 m -- Radial Z = 17.5 + j 7.5 -- Efficiency 22.5%
6.4 m -- Radial Z = 17.8 + j 7.5
6.6 m -- Radial Z = 18.0 + j 7.4
6.8 m -- Radial Z = 18.1 + j 7.4
7.0 m -- Radial Z = 18.3 + j 7.4
7.2 m -- Radial Z = 18.4 + j 7.3
7.4 m -- Radial Z = 18.4 + j 7.3
7.6 m -- Radial Z = 18.5 + j 7.2
7.8 m -- Radial Z = 18.6 + j 7.2
8.0 m -- Radial Z = 18.6 + j 7.2 -- Efficiency 22.4%

Note that after 4 m the antenna efficiency starts to drop,
which is not the case for large numbers of radials.

Now I have to figure out the best way to model a 100
radial system.

Frank

Howdy again:
I found out the info I was looking for on this type of antenna.
It is a loop used for NIVS mode of comunication.:

Hi Harbin,

On closer research, it is a loop antenna suited for MF to low HF (as
high as 40M).

This is from an interesting article in how the US Army has discovered
it needs HF comm gear to do the job satellites and VHF repeaters were
suppose to do:

1779. Re: Question on carbon fibre fishing rod

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-05 07:59:28 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <44d44fe0$0$35082$4fafbaef@reader4.news.tin.it>
Source record: 55116

As mentioned earlier, it not being easy to precisely predict whether and how much the conductive rod would influence the antenna behavior, I decided to buy a carbon fibre rod measuring 26.2 feet (fully extended). Its diameter varies from 1 1/8 inch at the base to just 1/16 of inch at the top. Its weight is just 0.7 lbs! At it stands very straight when you keep it horizontal.

The first test was to determine its DC ohmic resistance. This is a very difficult test as resistance varies a lot depending on how much you press the ohmeter leads against the rod. Let us say that, on the 1-inch diameter tube, putting the ohmeter leads at a 2-inch distance, and very strongly pressing the leads against the rod, I measured something in the range of 10 ohm. Then, keeping one lead firm, I slided the other lead across the rod: resistance was varying between some 10 and 20 ohms, but there was not a clear correlation between the leads distance and resistance. Anyway, despite no precise data could be obtained, at least I understood that the rod resistance is not all negligible and that it then would probably make little sense to use the rod alone as ground plane radiator (i.e. without a parallel copper wire).

I then laid a bare copper wire (0.1 inch diameter) along the whole rod (reduced in length to about 23 feet, so as to resonate on the 10 MHz band) and tightly taped it to the rod at its top, at its bottom and every about 3 feet. How good were the ohmic contacts between the copper wire and the rod is however hard to tell.

The rod was then erected, standing on an insulator at its bottom. The coaxial cable center conductor was connected to the copper wire (by the very bottom of the rod) and its braid to four radials laid on the ground. In this way the copper wire acts as radiatior, while the rod is just a passive structure put in contact with the wire every 3 feet.

Initial low-power tests at 10.15 MHz showed a very low SWR. Luckily the antenna length was appropriate.

I then applied a carrier at some 1500W and after a couple of minutes or so I saw the reflected power meter oscillating, until it suddently went up a lot.

I immediately went to inspect the antenna and I found that the rod was fairly hot. Moreover there were clear signs of sparking between the copper wire and the rod here and there, and the tape had melted at some points.

It can be concluded that the theory according to which the copper wire simply bypasses the rod due to its much lower resistance does not seem to apply. On the other hand I was feeding the wire, not the rod!

The explanation could be as follows. The RF current only flows in the copper wire due to its much lower resistance, and RF voltage then varies along the wire (maximum at the top, minimum at the base). If we now consider two points where the rod is taped to the wire (3 feet apart), there will be significant RF voltage between those two points. Then the conductive rod, subjected to that high voltage, draws significant RF current, so dissipating power.

Any other comment? An idea would be to spray the rod with a (really) conductive coating, but does such a varnish exist?

NEW: RoomCap 160 m Antenna
4th August 2006

I am glad to announce, that the 160 m version is ready, and has
been tested successfully.
This constitutes a new milestone in antenna technology!

The radiator measures only 2% of the wavelength and works equally
well as a 36 m longwire.
The length of the radiator is 320 cm, and the test antenna was
installed on my car.
Within a few seconds the SWR is set to 1.0 in the full band from
1.8 to 2.0 MHz, simply by
pressing a botton.

The last 4 nights I could test and compare this new antenne, and it
was a real pleasure.
However, one must be aware that the topband 160 m is a night band.
Band opening is about
at 22h, something for night fans.

The comparison was against a 36 m longwire, perfectly matched, 9 m
above ground in free
environment. Both station were operating with the same power, at
the same location (within 300 m).
(Thank you Sergio, HB9BXS for your preseverance!)

The remote stations gave the following reports, always after a
couple of short changeovers
between our 2 stations:

DJ5MX (B�blingen near Stuttgart) QRB = 170 km
- Roomcap is 1 S-point stronger

DJ1HS (Lauterhofen nr. Nuernberg) QRB = 360 km
- both stations have the same signal strength

DJ8YP (Sigmaringen) QRB = 140 km
- Roomcap about 3 db weaker

DD1IW (nr. Muenchen) QRB = 315 km
- both stations are about equal

G3IMX (Isle of Wight) QRB = 715 km
- Roomcap is 6 to 10 db stronger

G0RRM (Lichfield) QRB = 920 km
- Roomcap 1/2 S-point weaker

G3URM (Staffordshire) QRB = 940 km
- Roomcap about 1 S-point stronger

+ many other stations, confirming the same result.

The update for the owners of the construction guide is ready in
about 10 days.

Whether the current flows in the wire or in the rod depends on
inductance and inductive reactance.

A thin wire has greater inductance and impedance per unit length than
a thick rod.

Ok, that helped. My motor turned even slower than yours but I was using only
the roller inductor. The next time I try this I may use a stepper motor.

It MUST be a direct view from the antenna to the sat. Otherwise is it
just to forget it. With analog reception, the antenna can work very
well through a glass window, or while directing the antenna on a
reflexion (at least if you can afford a high end tuner in this last case),
by but with digital reception, even a tiny glass will cause a
lot of trouble (some channels will just disappear), because the digital technique use phase multiplexing
and the phase of the signal will change in a non linear fashion through
the glass or on a reflexion.

Dominique

1789. Frequency discriminator algorithms?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-05 13:17:44 UTC
From: neok <5b4az@qsl.net>
Message-ID: <1154783864.581373.12840@b28g2000cwb.googlegroups.com>
Source record: 55124

Hi all,

I had been searching the 'net for simple digital frequency
discriminator
algorithms (fm detection, eg for SSTV etc) but have not really found
any
suitable info. In the mean time though, I figured out what I think is a
simple solution to this problem and tried it, using my computer's sound
system to digitize a sinewave signal from my FT847 rig (tuned to a MW
BC
station in CW mode and using the narrowest filters).

The results were mixed, with an accuracy of about 1% in many readings
but with a small portion of them having large errors > 50%. The errors
seemed to be spaced at 1/4 of an audio cycle and near peaks and zero's.
But before I speculate on possible causes, I would like to take the
liberty to describe this algorithm so that experienced DSP boffins
might
first judge the viability and/or correctnes of it.

In a stream of digitized samples of a sine wave, the value s of a
sample
is given by s = V * sin(F) where V is the peak amplitude and F the
phase
of the sine wave at the moment the sample was taken. If we take three
consecutive samples, s0, s1, s2, we can form the following set of
simultaneous equations (by expanding sin(F+dF) & sin(F-dF)).

1. s0 = V*sin(F-dF) = V*{sin(F)*cos(dF)-cos(F)*sin(dF)}
2. s1 = V*sin(F)
3. s2 = V*sin(F+df) = V*{sin(F)*cos(dF)+cos(F)*sin(dF)}

where dF is the phase difference between successive samples.

By adding 1. and 3. we have:

4. s0+s2 = V*2*sin(F)*cos(dF)

By substituting sin(F) from 2. we have:

5. s0+s2 = V*2*(s1/V)*cos(dF)

So finally solving 5. for dF we have:

6. dF = arc cos{(s0+s2)/(2*s1)}

The frequency f of the sampled signal can then be estimated by:

7. f = (df/2pi)*S or f = S*arc cos{(s0+s2)/(2*s1)}/2pi (2pi=2*pi)

I tried this formula by feeding it with calculated samples and it worked
fine. In practice, the expected problems I had were division by zero when s1 = 0 and failure of the acos() C function when (s0+s2)/2s1 > 1. But there were inaccuracies in he results as I mentioned near the peaks and zeros since it seems errors in sampling by the dsp distorted the relationship between consecutive samples.

I am using Linux and an AC97 type on-board sound system and I already know there are some bugs in the ALSA (the Linux sound systems project) drivers. This is especially obvious when sampling at a non-native DSP rate (other than 48 Khz / 16-bit linear) where the sound driver has to resample the output.

I would be greatful for any input on the "legitimacy" of the above derived formula and/or its weak points, so that I can furher study the output of the DSP for possible errors (not very easy ;-)).

My apologies for a longish and/or possibly boring article!

Tony,

>From an EZNEC model with essentially the situation you described:
Wire numbers 2 and 5 are both 7.9m high, frequency 10MHz, fed against a
radial system in free space.

Wire number 2 is 25.4mm diameter, 21 segments, a 10 ohm load in each
segment, total "rod resistance" 210 ohms + negligable copper loss. The
wire centers are 7cm apart. Wire number 5 is 2mm diameter copper.
Wires 2 and 5 are shorted together top and bottom (no contact along the
length, but maybe we can see why you had arcing)

As you can see below, the currents in the two "wires" with the top and
bottom shorted are not in phase. Moreover, the current in the rod
(Wire No. 2) is quite appreciable, almost 2/3 that of the wire.

Wire No. 2:
Segment Conn Magnitude (A.) Phase (Deg.)
te1 W4E1 .39744 -167.9
2 .40049 -168.9
3 .39918 -169.3
4 .39463 -169.2
5 .38725 -168.8
6 .3773 -168.1
7 .36499 -166.9
8 .35056 -165.4
9 .33425 -163.5
10 .31635 -161.0
11 .29723 -157.9
12 .27734 -154.0
13 .25727 -149.2
14 .23781 -143.2
15 .22002 -135.8
16 .20528 -126.8
17 .19529 -116.1
18 .19188 -104.1
19 .19661 -91.39
20 .21058 -78.89
21 W3E1 .23611 -66.69

Wire No. 5:
Segment Conn Magnitude (A.) Phase (Deg.)
1 W6E1 .64698 170.23
2 .66204 169.08
3 .67227 168.00
4 .67834 166.94

5 .68045 165.86
6 .67871 164.76
7 .6732 163.63
8 .66403 162.44
9 .6513 161.18
10 .63513 159.83
11 .61567 158.39
12 .59307 156.82
13 .56752 155.11
14 .53922 153.20
15 .50842 151.06
16 .47537 148.63
17 .44036 145.82
18 .40374 142.51
19 .36589 138.50
20 .32725 133.51
21 W3E2 .28776 126.90

So how's the loss? Well, here's the table of load data:

Frequency = 10 MHz

Load 1 Voltage = 14.71 V. at -167.86 deg.
Current = 1.471 A. at -167.86 deg.
Impedance = 10 + J 0 ohms
Power = 21.62 watts

Load 2 Voltage = 14.82 V. at -168.9 deg.
Current = 1.482 A. at -168.9 deg.
Impedance = 10 + J 0 ohms
Power = 21.96 watts

Load 3 Voltage = 14.77 V. at -169.29 deg.
Current = 1.477 A. at -169.29 deg.
Impedance = 10 + J 0 ohms
Power = 21.81 watts

Load 4 Voltage = 14.6 V. at -169.24 deg.
Current = 1.46 A. at -169.24 deg.
Impedance = 10 + J 0 ohms
Power = 21.32 watts

Load 5 Voltage = 14.33 V. at -168.83 deg.
Current = 1.433 A. at -168.83 deg.
Impedance = 10 + J 0 ohms
Power = 20.53 watts

Load 6 Voltage = 13.96 V. at -168.07 deg.
Current = 1.396 A. at -168.07 deg.
Impedance = 10 + J 0 ohms
Power = 19.49 watts

```
Load 7 Voltage = 13.5 V. at -166.95 deg.
Current = 1.35 A. at -166.95 deg.
Impedance = 10 + J 0 ohms
Power = 18.24 watts

Load 8 Voltage = 12.97 V. at -165.43 deg.
Current = 1.297 A. at -165.43 deg.
Impedance = 10 + J 0 ohms
Power = 16.82 watts

Load 9 Voltage = 12.37 V. at -163.46 deg.
Current = 1.237 A. at -163.46 deg.
Impedance = 10 + J 0 ohms
Power = 15.29 watts

Load 10 Voltage = 11.7 V. at -160.97 deg.
Current = 1.17 A. at -160.97 deg.
Impedance = 10 + J 0 ohms
Power = 13.7 watts

Load 11 Voltage = 11 V. at -157.86 deg.
Current = 1.1 A. at -157.86 deg.
Impedance = 10 + J 0 ohms
Power = 12.09 watts

Load 12 Voltage = 10.26 V. at -153.99 deg.
Current = 1.026 A. at -153.99 deg.
Impedance = 10 + J 0 ohms
Power = 10.53 watts

Load 13 Voltage = 9.519 V. at -149.17 deg.
Current = 0.9519 A. at -149.17 deg.
Impedance = 10 + J 0 ohms
Power = 9.061 watts

Load 14 Voltage = 8.799 V. at -143.19 deg.
Current = 0.8799 A. at -143.19 deg.
Impedance = 10 + J 0 ohms
Power = 7.742 watts

Load 15 Voltage = 8.141 V. at -135.8 deg.
Current = 0.8141 A. at -135.8 deg.
Impedance = 10 + J 0 ohms
Power = 6.627 watts

Load 16 Voltage = 7.595 V. at -126.79 deg.
Current = 0.7595 A. at -126.79 deg.
Impedance = 10 + J 0 ohms
Power = 5.769 watts

Load 17 Voltage = 7.226 V. at -116.11 deg.
Current = 0.7226 A. at -116.11 deg.
Impedance = 10 + J 0 ohms
Power = 5.221 watts
```

Load 18 Voltage = 7.099 V. at -104.08 deg.
Current = 0.7099 A. at -104.08 deg.
Impedance = 10 + J 0 ohms
Power = 5.04 watts

Load 19 Voltage = 7.274 V. at -91.39 deg.
Current = 0.7274 A. at -91.39 deg.
Impedance = 10 + J 0 ohms
Power = 5.292 watts

Load 20 Voltage = 7.791 V. at -78.88 deg.
Current = 0.7791 A. at -78.88 deg.
Impedance = 10 + J 0 ohms
Power = 6.071 watts

Load 21 Voltage = 8.736 V. at -66.69 deg.
Current = 0.8736 A. at -66.69 deg.
Impedance = 10 + J 0 ohms
Power = 7.632 watts

Total applied power = 1535 watts

Total load power = 271.9 watts
Total load loss = 0.846 dB

The situation is VERY much improved by simply removing the top and bottom shorting wires (this changes the base impedance very much, by the way. I adjusted the source to still give ~1500 watts applied)

Total applied power = 1576 watts

Total load power = 30.53 watts
Total load loss = 0.085 dB

The current in the two wires isn't in phase either, but the average magnitude of the current in the rod is more than a factor of ten below the average magnitude of current in the wire.

So, space the wire a couple of inches out from the rod with insulators and you should be fine, except, as Reg said before, where the rod is 1/2 wavelength long.

If you still get heating, I suppose you'll just have to use the rod as a center support for an inverted-vee antenna or something!

The arcing is coming from the fact that the currents are out-of-phase by some amount (40 degrees) in the two conductors... and so are the voltages... you get a potential difference between a point on the wire and the corresponding point on the rod. I doubt it's sufficient to jump any distance air gap, it's more that the carbon can't take the current that wants to flow between the rod and wire and is burning, but that's just a guess, and you know how good my guess was originally.

1792. Spreadsheet for Yagi-Uda array of loops

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-05 15:18:48 UTC
From: Dominique Michel <dominique.michel@citycable.ch>
Message-ID: <20060805171848.3a8f7cf6@localhost>
Source record: 55028

Hi all,

I have done a spreadsheet for the calculation of Yagi-Uda array of
loops. You can get it on internet at
http://home.citycable.ch/monde-meilleur/index.html

Sorry it is in french, a direct link to the page where the spreadsheet reside is:
http://home.citycable.ch/monde-meilleur/antennes/antennes1.html

It is 2 versions, the original one for gnumeric at
http://home.citycable.ch/monde-meilleur/antennes/Antenne%20multicadres.gnumeric
and another one for excel at
http://home.citycable.ch/monde-meilleur/antennes/Antenne%20multicadre.xls

I have tested the excel version only with openoffice (I use linux at home) and it worked.

I have done a TV RX antenna on 487.25 MHz with just a few wood stick and some coaxial cable. It took me 2 hours of job, and I was able to receive with the color a channel I was just able to receive in black and white and a lot of snow with the biggest Wisi UHF antenna.

Such an antenna can outperform any commercial antenna. It will just become bigger as you get down in frequency. As example, a five elements 27MHz will do 9.5 meter length for a diameter of the active element of 3,89 meters.

Any comments are welcome.
I will appreciate very much If someone can take a look on my English and correct it. Just drop me a word or two.

Dominique

Hi ml

Do you intend to work AMSAT polar orbiting satellites?
Is your antenna stearable?
What frequency?

Jerry

Are you asking about amateur satellite operation or TV reception via satellites? Although Dominique's explanation of digital satellite signals passing through glass may be explained on paper, it has no merit in actual use. Some glass has attenuation at C/Ku frequencies but this purely shows up as signal reduction with associated loss of C/N, BER, etc in digital systems. Analog and digital satellite reception are affected the same.
Bob

Digikey carries a pretty broad line of Steward long form ferrite bead cores. You can check the specifications at http://www.steward.com/

For instance, core HFB143064-300 has an impedance of about 180 ohms at 146 MHz. Type HF is their highest frequency material.

Core 28B0562-200 (same size in the lower frequency, 28 material) produces an impedance of about 360 ohms per core.

I think both of these would fit over RG8X and are about an inch and an eighth long.

What I say here is based on personal experience. And it is for TV reception that use phase multiplexing in order to send many different channels on the same frequency. The signal going through a glass is affected in a way that do impossible to receive some channels. A bigger parabol will change nothing, it is just to remove the glass to get all the channels.

You get exactly the same effect if the shape of the parabol is not perfect (as it can append after a hazard under transportation), it will work just fine for analog reception but with a digital tuner, some channels will work when others will not. It is just to change the parabol to get all the channels. Sometime, the defect with the shape of the parabol is so little as you see nothing with the eyes, but you change it against another one from the same model and it just work. I installed hundreds of parabol antenna, and it was never a problem with a wholesaler or a manufacturer to change a defective parabol, they know this problem very well.

==========

Frank,

Thank you very much for the results on 8 radials.

As expected, it seems that for small numbers of radials the resonance effects are begining to appear again.

I have ideas as to why this should happen. It's to do with the geometry of the system and the fact that the ends of the radials are not terminated with true open-circuits when calculating input impedance. (As is assumed by program Radial3.)

I look forward to receiving results for 100 or more radials which may allow me to improve, in the mathematical model, the function of N which describes the system's input impedance in terms of the number N of radials.

But, let's face it, a good understanding of what's going on under the soil surface, without investigating input impedance at say 25 MHs, and without investigating input imedance at soil resistivities of say 2000 ohm-metres, will be known only crudely.

Is it all worth the trouble?

After all, we already know enough quite enough about radial systems at HF to design one which will work good enough, performance-wise, to keep anybody happy. (BL&E's work, as good as it may be, does not apply at HF.)

Just lay one or two dozen radials, in ordinary soils, with lengths equal to about half antenna height. Which is a good enough rule-of-thumb for anybody who doesn't expect to win contests because he has the advantage of 0.05 S-units.

And extremely few people know what their local soil resistivity is within +/- 40 percent. It's largely guesswork!

But please keep up the good work with NEC4 in which I have great confidence.

Reg, G4FGQ

Hi Reggie,

You "should" if you had read Brown, Lewis, and Epstein. They
discussed this nearly 70 years ago. Radial3 appears to miss that mark
by various amounts ranging from 6 to 60dB.

>It's to do with the geometry of the system

Duh. And the problem you injected in that you abstract one wire to
many.

>and the fact that the ends of the radials are
>not terminated with true open-circuits when calculating input
>impedance. (As is assumed by program Radial3.)

Given Hassan's and other's reports of the outrageous departures
between Radial3 and BLE/NEC4 (with your concurrence):
>But please keep up the good work with NEC4 in which I have great
>confidence.
there are at least two of us who find your contradictions would
warrant another fling of chalk off your noggin from Lord Kelvin.

Dominique,
I am also speaking from personal and professional experience with Ku
QPSK MCPC systems. Signal loss through the glass in dB correlates with
the same decrease in Eb/No in digital systems. I am curious what your
location is and what systems you have worked with.

I am in Switzerland now, but the location at that time (2 years ago) was near Malmö in Sweden.
The kind of system I was working with was mostly consumer grade electronics, 50 % Nokia complete sat system, and 50 % other brands as philips or samsung. All digital. A few years before that it was mostly analog systems, but the transition between analog and digital was going very fast.

I have done a few big installations too, but is was mostly mixed analog-digital cable TV here, or analog sat mixed with normal TV antennas.

For the sats, the most wanted was Sirius, Thor, Hotbird and Astra. And it was on ku band too.

For the parabol antenna, my favorite ones was nokia and Wisi. Wisi have a good quality and not only consumer grads products, but also professional material, and they have a technical staff that know the job very well.

Hi Reg,

You're saying that BL&E's work doesn't apply at HF. I believe that's an
overstatement.

They've shown that with about 100 radials of 0.4 lamba length the result is
almost perfect ground, regardless of the ground conditions beneath the radials.

I contend that using the radial setup as described above will always result in a
near-perfect ground at any HF frequency, with close to 100 percent efficiency.

Would you not agree?

==========

My dear Walt,

I haver never disagreed.

How can one disagree with a statement of the bleeding obvious?

Indeed, my program RADIAL3 confirms it.

And so will NEC4 if you will allow it time to generate some results.

Reg, G4FGQ.

True, the rod having a resistance by far higher than that of the copper wire, I would believe that current will anyway pass through the wire, despite its lower diameter.

Hi Dan

thanks for your in-depth analysis on EZ-NEC. The only step that surpises me a bit is that, with the top and bottom shorting wires in place, the current through the rod gets quite high, almost 2/3 that of the wire. On the other hand is always difficult to predict reality when electromagnetic phenomena are involved.

The next test you suggested, i.e. with the wire fully insulated from the rod, is just what I had in mind to do. A spacing of about 1-inch would be easy to get, by sliding the copper wire through the rings where the fishing nylon wire is supposed to run. So I'll do that first. I have a good quantity of silver-plated teflon-coated wire, so will try with that as it will stand a fairly voltage. I should be able to make that test by next monday or tuesday afternoon, and I will report results here.

Actually if the rod conducts it will share the current flow according to
the law or parallel resistance.

Hi Harbin,

After I posted, I got your follow-on with the same address. Spooky,
but seems we both homed in with the same Google terms.

So now I know what the communications cars looked like back then, and
more interestingly, that the US Army had walked away from their
historical HF operations much to the loss of their embedded knowledge.
It would seem if we ever went to war, they would be drafting Hams with
their gear again like in WWII.

By the way, if you want the convenience of the snap around cores in a
plastic retainer, part # 28A0593-0A2 provides 450 ohms per core at 146
MHz.. They cost about $2 plus shipping. They are about 2 and 1/4
inches long.

Did you do this yourself, or did you get a pro of some kind? I have tried to understand the advice I have seen (in particular the ARRL articles) but I've only become convinced that it needs more knowledge than I have, or at least that I could easily do exactly the wrong thing. Would any electrician know enough (I'm suspecting not) or some other professional?

Jim

A cheap tracking device can be purchased through one of the following pages.
http://tech-software.net/index.php?module=pagemaster&PAGE_user_op=view_page&PAGE_id=5&MMN_position=7:7
http://www.silcom.com/~pelican2/PicoDopp/PICODOPP.htm
I really don't think tracking devices have to be expensive but if you don't like paying for a good one, then I can provide a very simple 555ic timer circuit you can use that will cost about $10 to make.
Here is the circuit of a very simple but workable tracking device that I once used to track a signal to tandy's store in the toowong towers in Brisbane. Once you learn how to use it, you can track to a square metre. A hand held radio is the best choice of radio to use with the tracker. This shop blocked ch 7 for 3 days until I had some free time to go and see where it was coming from. The same shop did it again some time later and the culprit lost his job at that location thanks to a night time worker that was on the ball. The signal was a radio on the shelf connected to power with a small antenna and a clip lead over the mic insert to hold it on tx.

Hello,

I have the mentioned antenna but in the transport I lost my radials and manuals.

Can you be so kind to tell me the length of the radials. (Length with and without the threads) Also it will be nice to know the diameter of the radials.

Thanks in advance,

Adam, 9A4QV

Hi ml

The least valuable compass direction for you is either East or West, if
the satellites are Polar Orbiting Satellites.

In the limited amateur satellite action I've had I've needed all four compass directions but early on got away with only having an azimuth rotator, fixing elevation at about 50 degrees above the horizon. I didn't get the low el passes well or at all until I had an elevation rotor but it worked quite well most other times.

If you're thinking you'd only use an elevation rotor so you could track horizon to horizon I'd set it up on a north-south line, not only for the polar orbit sats but also it probably wouldn't be so bad for the others. If you're using yagis I'd put the elements perpendicular to the direction of tracking, parallel to the axis of rotation due to the beamwidth of a yagi in that direction.

Personally I'd start with azimuth only if I couldn't do both axis simultaneously.

Good luck,
Galen, W8LNA

If one wishes to operate legally on 11 meters do not use CW or tone CW.
The only legal modes of communicating there is AM or SSB voice. Tone
maybe used as an alerting mechanism but not for other methods of
communication.

Even though licenses are not required and most (not all) persons don't
follow the regs there, if you are caught violating the regs there you
can be refused an Amateur License. It can and does happen from time to time.

I built a 6 element 432mhz yagi from instructions in the ARRL Handbook. I used a 1" wood dowel for the beam and 1/4" aluminum rod for the elements. I used a "T" match on the driven element. One on each side, just like the illustrations show. And a 1/2 wavelength phasing line.

But the instructions don't show or say if the driven element is split in the middle.

Shouldn't the driven element be split.

1832. Re: Homemade 440 yagi question

Think of the "T" match (with the driven element) as being similar to a folded dipole. The element should not have a break in the middle, just as the second wire in the folded dipole should not. If you put a break in the middle, it would become for all practical purposes just a center-driven dipole.

Cheers,
Tom

This is true! As the man said, tho most don't follow them - they DO exist.
They WILL be enforced - if so desired. Actually, an infraction of any radio
rule can deem you ineligible for not only an Amateur Licence but also any
other license from the FCC - even GROL. IF you hold a GROL and do something
stupid with it, it can cause your "amateur" license to be stripped.
Ignorance is no excuse. When you sign the forms - and your license(s) - you
agree to abide by the R/Rs.

1837. HELP!! More Antenna Noise

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-07 20:52:16 UTC
From: Timothy@tholtom.freeserve.co.uk
Message-ID: <1154983936.154592.20990@i42g2000cwa.googlegroups.com>
Source record: 55074

In an earlier post (see Help!! Antenna Noise), I detailed how I live on the 9th floor (top) of an appartment block, had built a 1/4 wave vertical antenna, using a balcony railing as the counterpoise. When the antenna was connected to my handheld Yaesu VR-500 receiver (scanner/comms receiver), the result was noise at 8+ S units...

Two people very kindly responded to my original post, and suggested what I might do to find where the problem was. The antenna is picking up noise from somewhere (not the counterpoise or the connecting coax, they exhibit no noise when connected in isolation to the main antenna). Neither was the problem to do with the receiver being overwhelmed by the signal, as I drove into the countryside, setup the antenna, and the signal was fine...

I then tried the following:

1) Connected the small helical antenna that comes with the VR-500 and the noise
VANISHES. Good.

2) Connected a simple half metre telescopic antenna to the VR-500, and the noise returns. Not good...

Question: The helical antenna with the VR-500 obviously has some kind of loading coil, at the BNC plug end. So I was wondering exactly what kind of loading/matching, would there be in this antenna, that is able to sucessfully kill the noise that plagues me here in Brussels, surrounded as I am by tram and train lines (assuming this is the problem of course)?

Could I build something like this to filter the noise being picked up by my antenna? Any ideas? Circuit diagrams?

Thanks!!

Tim

You're correct - and just a few days ago - there was a case of a "licensed" individual who "allegedly" molested children and was convicted - the FCC was debating renewing his license. So, it appears they take a dim view on "criminals" being "license" holders. I guess they feel if you can't obey the law of the land, why would you obey their rules and regulations! I wonder if they take into account any one who's been convicted and had "successful" rehab? That would be interesting to know.

I once seen a copy of the "code" used by other countries. There were
"some" - if not many differences. I also seen a copy of "supposedly" the old
west code - used .... Man, what a difference - IF ALL WERE TRUE - that
is........ I'm only reporting what I seen, can't say for sure if true or
not. It was interesting to say the least.

Maybe - and I"m going on a limb here to guess - the "differences" in the
other countries code - was short hand much like our Q signals.

Hi Tim,

Absolutely none.

Try carrying your receiver around with that same small helical antenna attached, and turned on for monitoring. Walk through the hallways nearby your apartment on your floor, and the floors above and below you.

Go outside and do the same around the block. All of this shouldn't take more than an hour and should be conclusive. As you go along, you might try alternating between the small helical antenna and the simple half metre telescopic antenna which does pull in this noise.

Finally, what does the noise sound like?

10000uV/m at 30m is the maximum. How much power into an isotropic
radiator give 10000uV/m at 30m. Of course, when the antenna has gain,
power has to be reduced to avoid illegal operation.

Morse code as used by Western Union (when they did code) is different
from International Morse code as used by radio operators. Not very
different but different.

Because there are some differences in alphabets.

> I also seen a copy of "supposedly" the old
>west code - used .... Man, what a difference - IF ALL WERE TRUE - that
>is

That's American Morse, as opposed to International Morse, which is
used on the air. American Morse is composed of dots, dashes and
spaces. (Spaces are parts of the letters, not just the spaces between
them.) International Morse uses just dots and dashes - the spaces are
just spaces.

thanks very much, being a real newbie i have to ask one quick one

so are 'most' of the sat's polar orbiting?

thanks all again

i hate to loose a 'compas' heading but i can't move the wall or go over
it do to coop rules so just tring to figure out how many birds i'll
loose to see if it's worthwile

gwatts thanks for the help too, but i sure would have 2 rotors all i
would 'loose' is a single compas heading

Hi ml

I thought all the amateur satellites were polar orbiting. But, I really
am not sure. Perhaps you could Google then download Orbitron. That site
will show you all the satellites and their location as well as their path
prediction.

I'd strongly recomend your contacting the AMSAT group. There are some
very well informed guys there.

I mentioned that you might be willing to let your building shadow either
East or West only because there will statistically fewer times when
satelites will be passing there. the majority of the passes will be within
a sector to your North-South. You will have to consider what kind of
communication you want. That is, if you are interested in communicating
with someone in Europe, and you are located in Florida,
you sure wouldnt want to block out satellites to your East. But, if

you are in Maine, you may have little interest in communicating with stations to your North.

Source record: 54939

I had an NMO mount antenna on the roof of my truck that caught on an overhead door and was ripped out of its hole.
The metal around the hole is now enlarged and too warped to put the NMO mount back.

Does anyone know where I can get a rubber hole plug made to fit in the NMO mount hole?

Or an antenna mount that will is slightly larger in diameter. So that I could enlarge the hole and then reinstall an NMO base antenna?

I don't know exactly what I want to do, other than I do want an NMO mount in the roof of my truck.
Does anybody have any other ideas on how to repair or replace this antenna mount?

TIA

I am not sure if this is the correct place to post this, but I am in the process of switching from cable tv to an antenna. I had an old antenna that i recently took down and just put up a new 80 inch boom external uhf/vhf/fm antenna. I get VHF channels perfectly, but when i get above channel 11 all i get is fuzz. I currently have the external antenna connected to a 4 way splitter and from that splitter my signal reaches my various tvs. I am assuming this is a simple problem with needing an adapter of some sorts. Any advice would be appreciated.

Did you go into the menue and change the setting from CATV to Antenna? UHF
channels do not line up with any cable channels.

Have you told the TV that it is no longer on a cable? The cable channels
are different from the regular broadcast ones and a switch must be made
in the menu.

Make sure your TV has "antenna" selected instead
of "cable". I have the opposite problem. When I
have a power failure, my TV reverts to "antenna"
and I have to reset it back to "cable".

During my career, I generally used Antenna Specialists rubber hole plugs, Part No. ASP K35 for your application. I'd recommend just plugging the hole and drilling a new one... not too close to the old one. Also would recommend a little Silicone RTV on the hole plug before installing. Do a Google search on the part for vendors, or you could stop by a local commercial radio maintenance shop and ask if they would sell you one.

The level is the same as emissions within the CB band:

Sec. 15.227 Operation within the band 26.96-27.28 MHz.

(a) The field strength of any emission within this band shall not exceed 10,000 microvolts/meter at 3 meters. The emission limit in this paragraph is based on measurement instrumentation employing an average detector. The provisions in Sec. 15.35 for limiting peak emissions apply.

(b) The field strength of any emissions which appear outside of this band shall not exceed the general radiated emission limits in Sec. 15.209.

I don't know that there is a difference anymore between Part 95 and Part 15 emissions in the CB band... the old Part 15, back when a license was required, used to be 100mW.

A SHOT IN THE DARK!!!

This doesn't answer your question, but another.... What might be
causing the noise?

I had a couple of different 2 meter whip antennas with a base load for
the ht. One developed a problem with a bad solder joint which created
a diode effect, which acted like a receiver. It messed up my receive
something terrible. It never happened with the other antennas, but
they were built similarly. The rubber duck doesn't have the tuning
capacitor etc to match it as the whips did.

I think my antennas worked opposite yours. I had the 5/8 go bad and
the rubber duck work fine.

Other 1/2 wave and an unknown length whip work well without a problem.
The 1/2 wave and 5/8 wave whips both had tuning circuits in them.

Good luck

The amount of power applied to an isotropic radiator which will generate 10,000 uV/m at 3 meters is 30 microwatts. This assumes that the 3 meter distance is in the far field, or that it's measured in the far field and extrapolated to 3 meters as though 3 meters were in the far field, which is the method and assumption used by the FCC.

A simple dipole reduces the permissible power to about 23 uW, and ground reflections will typically nearly double the field strength, so a safe power level would be about 6 microwatts into a dipole antenna over ground for someone interested in conforming to the regulations.

Not true. Hams care much more about saving lives than operating appliances.
I'm betting a great number of them have their CPR cards,
ready for action. Self-cleaning ovens run a sad second place to standing
tall at the 911 center.

On your other point..
Most hams are men and they generally don't know how to operate any appliance
except the refrigerator door,
and maybe the microwave oven. A few are versed in toaster operation, I hear.

However; they will indeed spend hours installing flashy lights and
noisemakers on their cars, as well as
spend hours 'standing by' and preparing for the life-saving moment. They'll
spend grocery money to purchase a
plethora of other "necessary" equipment and "uniforms/ID/look-at-me" items.
Be it weather watching, crowd control, parade control, or just control in
general, hams are standing by to manage the world, after the "big one"....
Hams just like you, Dirk. And for that, I thank you.

I can only pray for peace on these hams as they spend their last days
brushing the fallen hair
from their rigs. Saving countless lives in the aftermath, diligently
tapping away; giving
needed instruction to all the elderly survivors crowded around their
homemade QRP
battery operated rigs..... Oh, and lest we not forget the generator owners
crowded around their swans, drakes and 101e's... burning precious fuel to
strain an ear
for the faint but all-knowing dit-dah that will be their salvation.
I'd bet with a 100w rig pushing a 600-1Kw amp [and a break in the fallout],
they could work weak signal maybe 10-20 miles
through the new noise floor.

As for me, I'll be listening too,
voice, morse and digital.
Coz by that time, the only appliance I'll be operating is that new
one-button rig from GLOCK.
....and I love ham.

LOL...
btw, trolls suck.

No, the driven element can be one solid piece...you just connect the shields of the "phasing line" to the driven element right where they exit on each side of the boom. The centers of the phasing line connect to each side of the T match where they come out of the boom. The T match sections ARE split. That's how I did my 222 yagi that I took out of the ARRL antenna book (the old NBS designs).

Rats, now you have me intrigued Walt. Too bad the pic did not work.
Just tried to post a picture, but it seems there is a filter on the NG to
prevent such postings.

Reg, have made a lot of progress in developing a NEC 4 model
of a 100 radial system. Just have to iron out a few bugs. When this
is completed I can try some high frequency models.

Hi Frank,

I used the 'help' menu in Agent, but it doesn't seem to let me post an attachment. Guess, like you said, it must be an NG rule that prevents it. Anyhoo, jist fertheleovit, I'm going to email you the jpg file fyi.

Walt, W2DU

Yes Walt, I got a message in the send window that said the NG rejected it.
Don't forget to removed the "nospam." from my e-mail address, also note
the period after the "m"., which must also be removed.

Will be curious to see the jpeg, but doubt I will be smart enough to figure
it out.

Thanks,

Frank

Hi Reggie,

You prove you can write in English, but equally proven is that this
post is as obscure as reading Beowulf. However, it is equally notable
that most English speakers have some of the poorest grammar:
>These days, there are mostly Tom's, Dick's and Harry's!
where possessive case substitutes for plurals.

Is this the standard troll, or whining? Do you somehow feel
disappointed that Engineers don't create art? Has your esteem for
British luminaries suddenly dimmed by their lack of imagination?

I for one cannot imagine Bill Thomson sitting on a Parisian sidewalk
doing chalk copies of renaissance art - unless he was anticipating
your holiday so as to wing that chalk off your noggin.

Or perhaps you pine for the lost opportunity of Auguste Rodin
sculpting Pascal code out of marble. Whoops! A frog there. Perhaps
a Tom Gainsborough sloshing the paint to rummage up an astable
multivibrator.

Oh for the days when they were mostly Toms, Bills, and Augustes....
and Marcels - "ï¿½ la Recherche du Temps Perdu" Now there's a French
sleeping pill no engineer would copy.

Hi Dominique,

I doubt that your spreadsheet will give accurate design information for
actual design.
As you already mentioned, it has it's limitations since it will not give
gain, f/b and antenne impedance as
a function of operating frequency.

I have done quite a lot of loop yagi antenna modelling in NEC2 and MMANA and
I found out
that the loop yagi performance is infuenced quite dramatically by the
physical dimensions of the
individual loops and their relative position. I have not mentioned the
effect of the element diameter.

In addition I have built several loop yagi's. Testresult of my 6 element 2m
loop yagi can be
found on the internet (google: loop yagi pe2wdo).

If you are interested I can send some design details of my loopyagi design.

Best regards,

Willem
PE2WDO

Hi Dan

thanks for your in-depth analysis on EZ-NEC. The only step that surpises me a bit is that, with the top and bottom shorting wires in place, the current through the rod gets quite high, almost 2/3 that of the wire. On the other hand is always difficult to predict reality when electromagnetic phenomena are involved.

The next test you suggested, i.e. with the wire fully insulated from the rod, is just what I had in mind to do. A spacing of about 1-inch would be easy to get, by sliding the copper wire through the rings where the fishing nylon wire is supposed to run. So I'll do that first. I have a good quantity of silver-plated teflon-coated wire, so will try with that as it will stand a fairly voltage. I should be able to make that test by next monday or tuesday afternoon, and I will report results here.

Hey, Roy -

My 3 mW answer was for 30 meters. I think that ratios correctly to your 30 microwatts at 3 meters. Yes?

John

Yep, that's right. And I finally got curious enough to look up the actual regulation. According to section 15.225(a), intentional radiators at 13.553-13.567 MHz are allowed 15,848 uV/m at 30 meters, which is about 4.75 mW to an isotropic antenna in free space. There's also a 0.01% frequency stability requirement which would imply crystal control. And any emissions extending outside the band have to be about 54 dB lower, 30 uV/m at 30 m.

1884. Aluminum welding wire (AlMg3) for radials on galvanized metal roof?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-08 22:40:43 UTC
From: TF3KX <kristinn1@gmail.com>
Message-ID: <1155076843.566944.91920@i3g2000cwc.googlegroups.com>
Source record: 54971

I am about to mount a vertical on a galvanized sheet metal roof. There are indications that this roof, while farily new and in good shape, may not be a sufficiently good enough ground plane by itself. So, I will additionally lay radial wires on the roof. For this I select aluminum, as I expect (a) low corrosion when touching the zinc-galvanized iron, and (b) good conductivity of the aluminum.

Readily available aluminum wire would be the kind used for welding, sold as AlMg3 (aluminum with 3% manganese). Does anyone have expericence or comments on using this type of wire? Such as:

- The expected RF conductivity? (brief research indicates not much less than pure Al)
- Corrosion resistance of this material (by itself)?
- Corrosion resistance in contact with galvanized iron?

Other comments?

1885. Galvanized iron - a poor ground plane?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-08 22:49:15 UTC
From: TF3KX <kristinn1@gmail.com>
Message-ID: <1155077355.214250.181090@m79g2000cwm.googlegroups.com>
Source record: 54972

I have been considering a vertical setup on the top of my galvanized sheet metal roof and using the roof as a ground plane. My brief tests so far indicate that the performance of such a setup does not deliver as strong signals to my RX as my simple inverted-V. Nevertheless, my roof is only 2 years old, still in good condition and with well overlapping sheets.

There may be various reasons for this, but it has occurred to me that the galvanized roof may not be such a good RF-conductor. Due to the skin effect much of the current would run in the zinc coating, for which I do not have much information on as far as RF-conductivity goes. Does anyone have a comment or suggestions on this?

By the way, I am going to try to lay additional wire radials (aluminum welding wire) on this roof, which is the subject of a post I just sent out before this one.

It is not a broadband antenna, but a channel antenna.
On the central frequency, you will get a resistive impedance in all cases with it (, so it must be very easy to interface it with a transmission line.

I just trust the Balanis. The antenna is optimized for the maximum forward gain, but the calculation of that gain is not in this book. It use other references as some IEEE papers and I don't have them.

A. Shoamanesh and L. Shafai, "Properties of Coaxial Yagi Loop Arrays" and "Design Data for Coaxial Yagi Array of Circular Loops"

>
I have done only a few test with the NEC2 software. I know at the original NEC2 code is quite old now. The theory in the balanis is very recent, and I trust more my own calculation based on the Balanis as the NEC2 calculation.

I don't know MMANA, so I cannot speak about it.

> In addition I have built several loop yagi's. Testresult of my 6 element 2m

I found a 2005.xls file with a comparison between different antennas, among them a few loop yagi.
What's look strange to me is at you get a gain of 9,2 dB with a 144MHz loop yagi 7 elements, and 10,8 dB with a yagi 7 elements. According to Balanis, it must be the contrary. The loop yagi must have more gain as the dipole or linear yagi. But maybe at you have another optimisation as for the max forward gain.

1888. Re: Galvanized iron - a poor ground plane?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-08 23:21:04 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <0r6dnZki4Kb6v0TZnZ2dnUVZ8smdnZ2d@bt.com>
Source record: 54975

The RF resistance of the galvanized steel roof will be sensibly zero due to the very large area of the 'skin'. (relative to diameter of radial wires).

If you wish to use radials they may just as well be attached to the edges of the roof. This will effectively increase the area of a small roof.

The difference in received signal strength compared with an inverted-V is probably due to the difference in polarisation. A vertical on the roof may be better for DX.

==========

Frank, don't forget to use a 1/4-wave vertical when calculating
efficiency.

I assume you always include the power in the ground wave in the total
power radiated when calculating efficiency.

I think radial length intervals of 0.5 metres will be OK for 100 or
more radials.

So if N9OGL's transmitions are legal power wise, he would basically be
broadcasting for the kids across the street. Maybe he could take song
requests. They can just shout out their front doors what songs they want
him to play.

I can copy perhaps 8 beacons on 13.555 MHz from all across the U.S.
Assuming they too are running the power level Roy calculated, N9OGL's beacon
should also be copyable.

Not true.
I have an AM "beacon" running some test groups smack dab
in the middle of the HiFer/ISM 22M allocation. At maximum power
I am at the legal limit. Most of my tests are -20dB from that level and
I
have copied my "becaon" from over 100 miles away twice. I was -6dB
down from max, and was rather shocked. Don't rule out the odd fluke
path.

If you ever hear a YL reading a set of word pairs each followed by
a ID nubmber in cut morse, that is my odd little station.

I normally keep the power -63dB down from max legal, and only boast
it while actually conducting tests.

The surface area is so large that you wouldn't be able to tell the
difference between zinc and a perfect conductor.

That doesn't make any sense to me, unless you're concerned about the
quality of the contact between sheets. Even then, I'd think that the
capacitance would be adequate.

The surface area of the wire is great enough that you won't be able to tell the difference between it and a perfect conductor. But it will still have more resistance than the roof.

> - Corrosion resistance of this material (by itself)?
> - Corrosion resistance in contact with galvanized iron?

I avoid letting aluminum contact galvanized steel because it quickly plates the zinc off and allows the steel to corrode. But I'll defer to people with more experience.

> Other comments?

This doesn't make much sense to me. What are the "indications" that the roof isn't a good ground plane? What size is it, and at what frequencies are you attempting to use it?

Hi Kristinn,

Effectively the radials will not even be seen by the Antenna because of the large metal surface area of the Roof. As Reg Suggests the only way you may improve the situation is to attach radials to the roof edge and have them extend the length of the ground plain system. A better method under the condition you have stated may be to be sure the bond between roof panels is RF/electrically good and add radials to by connecting them to the roof panels at the edge of the roof. You do not mention the Frequencies of Interest. Aluminum on Zinc is not a good Idea. There will be interaction and it will create noise on RX in short order.

you would be better off raising the radials off the roof by some distance if you decide to go that root.

hope this helps. 73 Dave, KC1DI

I'm trying to tune a 2 mtr, 3 element beam that has a gamma match.
After connecting the coax to the driven element & adjusting the
matching unit, where should the coax exit in relation to the boom & the
elements? Should it travel along the boom or drop straight down next to
the driven
element? Any assistance concerning the above would be most appreciated.
Thank You.

I have always run mine below the boom to the mast and then down the
mast, into a drip loop and below the rotor, making sure there is
enough room to turn the rotor without stretching the coax out of the
drip loop.

In order to post a jpg you would need to essentially convert it to
text. I think a program called uuencode does it.
Then it comes out looking like 15,000 lines of garbage to anyone
reading the articles here. It would make you a lot of enemies faster
than calling CQ on 14336.

Put it another way - the rec.radio newsgroups are text only.

FS: DX ENGINEERING BALUN
MODEL DXW-BAL600-H10-A
12:1 high power, rated for 5 kw continuous, 10 kw intermittent, easily
handles full-limit AM or SSB. 1.8-30 Mhz, suitable for wide spaced 600
ohm open wire feeders.
Like new, used approx. 6 months, installed indoors, has never been out
in the elements.
See
http://www.dxengineering.com/Parts.asp?ID=97&PLID=50&SecID=10&DeptID=33&PartNo=DXE%2DBAL600%2DH10%2DA
for detailed specs and photo.
$125 includes shipping anywhere in continental USA.

> more radials.

Reg,

I have always used the 1/4 wave vertical to calculate efficiency.
Most of my calculations do not include the surface wave. The problem
with including the surface wave is that it is computed over a cylindrical
surface at x meters from the antenna. Technically not a surface, but
rather a vertical line in cylindrical coordinates. The surface is implied
due to the expected symmetry of radiation. In my calculations I have
taken "x" as 200 m, so as to ensure the result is in the far-field at 8 MHz
(nominal 5 wavelengths). I compute the field at 1 m intervals, in the "z"
direction to 200 m. To include the total field I would have to allow z
to approach infinity. Taking these data from the NEC output text file, I
import it to Excel. In Excel I compute the radial distance and elevation
angle to the source. Since my increments are in steps of one meter
I can only approximate integral degree points; removing those points
far from integral degrees. I could employ
linear interpolation, but the field intensity variation is relatively
smooth,
and adds no discernable ripple to the radiation pattern. I then
normalize these data to 1 m to match the spherical data for the
sky wave pattern. At 45 degrees elevation there is very little
ground wave effects, I can then combine the two normalized
sets of data, and numerically integrate over a hemispherical surface.

Sorry to bore you with these details, but just to give an idea of
the tedious steps involved in including the surface wave. To compute
the total radiated sky wave involves a simple command in NEC.
Just the same I can compute the total radiated power at 0.5 m
and 10 m radial lengths as a comparison. At every 0.5 m it would
drive me nuts.

Attempting to model a 100 radial system I continually run into
road blocks. At one point I had a complex matrix with 3.6
million entries. Still I think I have a viable model that needs
just a little refinement. Due to the rotational symmetry of the
structure I can employ methods that greatly reduce run time. The

model that should work will consist of thirty-three 10 cm radials. At the end of these short radials I connect three 9.9 m radials for a total of 99 radials. If I run into problems I may have to reduce the segmentation to 25 cm. What is interesting, in my preliminary results, is that there is only a 2% improvement in sky wave total radiated power with 120 radials over 36 radials.

Few news servers will handle binaries.

Almost every news reader will automaticaly ASCII encode a binary on
transmission and decode it upon receipt.

That's a bit simplified, but basically how it works.

>Thank You.

Your description is not entirely clear, but I interpret it to mean you have a vertical beam. In that case you should not have any additional vertical conductor within about 0.2 wavelengths to the rear of the beam, or anywhere within, near, or in front of the beam.

So... if that is the case, you could route the cable from the feedpoint, back along the boom, and continue in that direction for a further quarter wave or more before dropping the cable down.

There are other ways to get the cable away without disturbing the pattern and feed point impedance.

Owen

You don't need to tell me the strengths of CW. I'm a CW advocate.
Just listen to the NCDXF beacons on 14.100. You can easily hear the 100mW
tone all over the world when there is propagation with a simple antenna.
I'm just saying the RF Todd is puting into his antenna has to be quit low
if he is transmitting legal power wise.

Problem with the 336 crowd is that they almost never check before _they_
transmit up or down the band. And if they do check, they wait about 500
milliseconds before they figure the freq is clear. They have lots of
enemies themselves, myself being one. They have a very poor reputation
on 20.

Drop it down the mast on the opposite side of the antenna element. I
know some element(s) are probably near the pole, but to one side of
it, but put the coax on the opposite side of the pole. There should
be no further interference with the signal than the pole already
offers.

You couldn't be more wrong. If there were practical exams for SSB, FM,
AM, FSTV, SSTV, RTTY (which is pretty darned old), packet, PSK, etc,
then it would be CRYSTAL clear that a Morse Code exam is valid.

However, there are no such practical exams for the other modes. So
there need be no exam for Morse Code, either.

> >> >How progressive is it?

That is not true. You wish to change the written exams, not add
practical exams for SSB, FM, AM, FSTV, SSTV, RTTY (which is pretty
darned old), packet, PSK, etc.

> Those who want CW dropped just
> want what they can't memorize dropped so they can get a ticket without

What if you forgot your band edges?

> >The amateur is self-policing, and you no longer meet your own standard.
>
> Sure I do. The test wasn't to remember what circuits to draw, it was
> to draw them. And I can draw them any time.

Then do so. Quit complaining to me that you can't remember what it was
that you were supposed to draw.

> >> They're still as relevant today as they were 50 years ago.
>
> >Other things are relevant today that weren't even known 50 years ago.
>
> So let's have them on the test.

But if a practical exam is necessary for Morse Code, why isn't it
necessary for other modes? If all radio is merely plug and play, why
do the services still have radio schools (that aren't teaching Morse
Code)?

> Oops, that's right - no more relevant testing, isn't that what people
> are asking for? Just give me the answers so I can memorize them and
> pick them out on the test.

Who said that? We absolutely NEED relevant exams. That is my whole
argument!

Not in Morse Code. If you must retain a Morse Code Exam, then you must
also administer practical exams for SSB, FM, AM, FSTV, SSTV, RTTY
(which is pretty darned old), packet, PSK, etc.

> >> So you'd get a license not knowing CW, build a radio (you couldn't buy

Correct. And no one has a right to force their favorite mode on
everyone else. Your days of doing so are numbered.

We aren't made to memorize every value of resistor and capacitor, or
every offset for the six meter repeater subband.
```

Heaven forbid that someone assumes that a lowly, unwashed Technician
know the CODE.

> lou

Many "assume" that an Old Timer knows more than they actually know. Most Old Timers are guilty of this kind of thinking. Furthermore, many "assume" that newcomers to the hobby know little or nothing, and have no desire to learn. Most Old Timers are guilty of this klind of thinking.

Do what??? The power output can vary depending on a number of things including coax and antenna, you can run 1,000 watts and come up 10,000 uV/meter at a distance of 30 meters. As the FCC Office of Engineering and Technology has stated in their bulletin which deals with Part 15.

"What is the relationship between "microvolts per meter" and Watts? Watts are the units used to describe the amount of power generated by a transmitter. Microvolts per meter (µV/m) are the units used to describe the strength of an electric field created by the operation of a transmitter. A particular transmitter that generates a constant level of power (Watts) can produce electric fields of different strengths (µV/m) depending on, among other things, the type of transmission line and antenna connected to it. Because it is the electric field that causes interference to authorized radio communications, and since a particular electric field strength does not directly correspond to a particular level of transmitter power, most of the Part 15 emission limits are specified in field strength."

PART 15 in the CB band is 10,000 uV/meter @ 3 meter (100 mw).(Walkie
talkies and cordless phones are also 10,000 uV/meter @3 meters) While
on 13 MHz it's 10,000 uV/meter @ 30 meters or about 1.8 watts at 100
feet.

>However, there are no such practical exams for the other modes. So
>there need be no exam for Morse Code, either.

That's my point - there's no test any longer. For anything more than
the ability to memorize answers.

>That is not true. You wish to change the written exams, not add
>practical exams for SSB, FM, AM, FSTV, SSTV, RTTY (which is pretty
>darned old), packet, PSK, etc.

Add SSB, FM, etc., to the nothing there is today.

>So all ham radio is is Morse Code on HF? Or is it more than that?

It's a lot more. The question isn't what ham radio is, it's whether
one should be required to pass a realistic test to get a license.

>> No, I'm not addressing *where* the test is held at all - I'm
>> addressing *whether* there's any real test, which there isn't, except
>> for CW right now. Spitting out something you memorized is only a test
>> of memory.

>Sounds like the Conditional License to me.

The Conditional was whatever class was being tested for, but not at an
FCC office. It had nothing to do with the class, only with the
location.

>> I don't remember after almost 50 years - but I could still draw them
>> today, and it's not a test of remembering what's on the test, it's a
>> test of knowing what's in a radio.

>Then advocate passing the current exam at every license renewal.

What current exam? Memorizing answers and writing them down isn't a
test.

> You'd probably be weeded out pretty quickly.

I doubt it - if I couldn't pass an Extra theory exam - a real one, not
the nonsense that passes for one these days - I'd lose my job in a
second.

>> >> From scratch. Let's see how many people could do that today. A
>> >> Colpitts oscillator, a Hartley oscillator and some other circuit that
>> >> I've forgotten at the moment.

>> >You should self-modify your license and cease amateur operation until
>> >you remember.

>> Why? Testing isn't about memory, it's about knowledge.

>What if you forgot your band edges?

What if you addressed what I said when you answer me? Your dishonest
tactics are transparent.

>> >The amateur is self-policing, and you no longer meet your own standard.

>> to draw them. And I can draw them any time.

>Then do so. Quit complaining to me that you can't remember what it was
>that you were supposed to draw.

Quit putting words in my mouth. I wasn't complaining to anyone, and
we weren't discussing remembering 50 year old tests.

>> >> They're still as relevant today as they were 50 years ago.

>> >Other things are relevant today that weren't even known 50 years ago.

>> So let's have them on the test.

>But if a practical exam is necessary for Morse Code, why isn't it
>necessary for other modes?

Maybe we should have one - show the ability to put a clean PSK signal
on the air. Show the ability to interpret a waterfall display. Show
the ability to tell the difference between various digital modes. The
bands would be pretty QRM-free.

> If all radio is merely plug and play, why do the services still have radio schools

That's my point, not yours. Or don't you understand what you just
said?

>> Oops, that's right - no more relevant testing, isn't that what people
>> are asking for? Just give me the answers so I can memorize them and
>> pick them out on the test.

>Who said that? We absolutely NEED relevant exams. That is my whole
>argument!

So you're in favor of exams that test knowledge of theory? "Draw the
schematic of ..."? "Explain why long path 2400 bps is impossible on
14 MHz"? That kind of relevance?

Or the "pick the answer with the resistor like we showed you in the
example" kind of relevance?

>> >> But you had to actually *know* a little theory to use one legally.

>> >No you didn't.

>> Yes, you did - you had to pass a test to show that you did.

>There has never been a practical test to show that you could operate a
>radio. Ever.

Do you understand what the word "theory" means?

>> All you
>> have to do now is memorize a few answers.

>That's all you had to do then.

How do you draw a schematic and explain the functions of parts by
memorizing answers? You can't explain phase shift by memorizing "10k"
or "coil".

>> >I used radios in the military. I never used a CW key in the military.
>> >I never jammed another operator, although Brandywine asked me to reduce
>> >power once.

>> have it", which is what I'm talking about. No one has any "right" to
>> get on the air.

>Correct. And no one has a right to force their favorite mode on
>everyone else.

I'm advocating real testing for whatever mode. Right now the only
test is "do you have the fee, can you get to the testing place, and
have you memorized enough answers to pass". Let's have a test that
shows whether the testee knows anything. CW, APRS, AX25, PSK - all of
it. Or separate the licenses. You want to operate FM, you take a
test on FM and, if you pass, you get an FM license. Want to operate
SSB, you take a different test.

Not "want to get on the air? memorize some answers and pay your fee".

Hello Brian,

You are engaging in old-time necro-equine flagellation here with
this "Al Klein." I suspect he will not buy rationality and come
back with more of the ARRL-taught-and-sponsored emotionalism
about radiotelegraphy.

The fact that the World Radio Conference of 2003 amened the
amateur Radio Regulations seems to be lost to the brainwashed.
Prior to July 2003 *all* nations *were*required* to administer
International Morse Code proficiency tests to amateur radio
license applicants. *All* No exceptions. After July 2003
*all*administrations* were free to test for morse or junk the
test.

In mid-2003 the ONLY non-amateur radio service in the world that
even bothered with manual radiotelegraphy were some ocean-going
vessels who had not bothered to update to Data and SSB like the
bigger ocean shipping concerns had already done for years.

>> Sure it is. "Beefing up" the written exam is a counter to "drop CW
>> because it's old fashioned". If you want modern you want the testing
>> to be turned from CW to modern modes.
>
>That is not true. You wish to change the written exams, not add

>darned old), packet, PSK, etc.

Klein seems to be thinking the AMATEUR radio test "has" to be
as "tough" as the commercial licenses. AMATEUR radio is about
hobby pursuits, a pastime done for personal pleasure. It is
NOT some professional activity (except in the minds of a few
dwelling in fantasyland).

I've had a Commercial ticket since March, 1956, passing it at
an FCC Field Office on first go. It didn't hurt that I'd already
had three full years of big-station Army communications for prior
experience.

The United States Army did NOT require me to "know CW" in order
to keep 30 to 40 HF transmitters on the air or keep 9 24-channel
microwave radio relay terminals operation 24/7. At the same
time I had to be proficient in "destroying the enemy." That
was in 1953 to 1956.

>> Those who want CW dropped just
>> want what they can't memorize dropped so they can get a ticket without
>> really being tested on anything.
>
>So all ham radio is is Morse Code on HF? Or is it more than that?

It's "Working DX on HF with CW." :-)

ARRL has worked the CW thing to death ever since Hiram Percy
went beyond the ionosphere over 70 years ago. Newington got
brainwashed by "T. O. M." long ago and never went into detox.

>> No, I'm not addressing *where* the test is held at all - I'm
>> addressing *whether* there's any real test, which there isn't, except
>> for CW right now. Spitting out something you memorized is only a test
>> of memory.

>
>Sounds like the Conditional License to me.

Klein really seems to want a Professional license exam for
AMATEUR activities!

Unless there's been a change in the Communications Act of 1934
and the Telecommunications Act of 1996 as of this Wednesday
morning, the FCC was NEVER EVER chartered to be an academic
institution.

Radio amateurs are AMATEURS by definition.

>> >> Just by guessing at the

I can still remember my First 'Phone test. Took two hours. Four
parts to get a First. I recall four schematics...ALL on vacuum
tube circuitry. [this was in 1956 and there were NO RF power
transistors available anywhere]

Anyone who hasn't kept up with the state of electronics would be
totally LOST inside a modern HF transceiver...probably dumbfounded
by any HT using SMDs. :-)

>> >> From scratch. Let's see how many people could do that today. A

>
>> Why? Testing isn't about memory, it's about knowledge.
>
>What if you forgot your band edges?

[change band surgeons? :-)]

No problem for me on Klein's "challenge." I can name four more
basic oscillator circuits, draw them out, simulate their operation
in SPICE after calculating the values with a pocket calculator,
build the little suckers, adjust them, measure their characteristics
and even design-build impedance-interface networks for outputs.
Of course, the challenger has to PAY me for that...I AM a pro

and other folks have paid me for such services for a half century.

Ackshully, about half the commercial ticket questions were on
Rules and Regulations. The theory part was cursory to the subject
and not near enough complete to "qualify" for expertness in radio
or associated electronics. As I've seen since, they still ran
heavy for Rules and Regs for the next four decades. It should.
Not even the commercial ticket is any kind of "diploma" of
knowledge.

>> >The amateur is self-policing, and you no longer meet your own standard.

>> to draw them. And I can draw them any time.
>
>Then do so. Quit complaining to me that you can't remember what it was
>that you were supposed to draw.

Not many tube Hartley oscillators used nowadays. :-)

I see more Yamahas than Hartleys... :-)

>But if a practical exam is necessary for Morse Code, why isn't it
>necessary for other modes? If all radio is merely plug and play, why
>do the services still have radio schools (that aren't teaching Morse
>Code)?

There is NO practical reason for a manual radiotelegraphy test
today. There is only the EMOTIONAL demand of some old-timers
for all to do as they had to do.

>There has never been a practical test to show that you could operate a
>radio. Ever.

Correct for the United States of America.

[waiting for someone to trot out the Russian amateur test...I'll
give them a year's subscription to The Daily Worker...:-)]

>respect, or apatite for knowledge. Far from it.

ABSOLUTELY TRUE, Brian! :-)

Heh heh, I'm one of the (chronological) Olde Fahrts and KNOW what
his generation's opinions ARE. God help me if I ever get as
stodgily self-righteous as some of them! :-(

>> >I've listened to emergency responders on a scanner before. They don't

>(which is pretty darned old), packet, PSK, etc.

Having once had a scanner to listen to (idly), civil aircraft pilots
and tower controllers get right up there on voice speech rates,
faster than most PLMRS Safety radio services (even police). Then
there are the UNtrained radio users such as harbor and inland
waterways communicators, the vast majority being untrained
(horrors!)
civilians (more horror!) communicating just fine on their store-
bought, usually-installed-by-others VHF voice radios.

The difference between them and amateurs is that the above are MORE
concerned about INFORMATION; amateur morsemen are much more
concerned about the MEDIUM, of USING Morse.

To paraphrase McLuhan a bit, "Their medium is their ego massage."

>> But an award for wanting has to do with "I want it so it's my right to
>> have it", which is what I'm talking about. No one has any "right" to
>> get on the air.
>
>Correct. And no one has a right to force their favorite mode on
>everyone else. Your days of doing so are numbered.

I think they expired long before WRC-03 was finished.

It seems that Klein and other Olde Fahrts are mostly looking for adulation by others for being so old in amateur radio. Their self-righteous attitudes stick out all over, demanding that "young folk" do what They had to do...or else. :-(

I could care less what was "expert" in radio in 1932. Two decades plus one after I was born I began using Big-Time HF radio communications and KNOW what was "expertise" from seeing (and emulating) the REAL experts of then. It was NOT morse code or manual radiotelegraphy as "best" a half century ago. Manual radiotelegraphy has been slowly dying towards obscurity ever since...but the chief media agency for ham radio in Newington still believes in it and promotes it constantly as "the best skill" in amateur radio to this day. A rather disgusting RETRO attitude of theirs in my opinion.

Klein really doesn't understand human history or humans, for that matter. EVERYONE has wanted "instant gratification" for something or other for all of recorded history. Even in amateur radio. Some companies in the 1920s were selling ready-built amateur radios, back when manual radiotelegraphy was about the ONLY mode available to the ham community. [that's 80 years ago, four generations, in case some of his contemporaries are afflicted with Alzheimers]

But, if Newington wants the test, then the test will remain. ARRL "represents 'all' amateurs," donut? :-) ARRL is Big Business (to the tune of a reported $15 million profit now) and Big Business SPEAKS. :-(

>the ability to memorize answers.

1. The FCC does NOT generate the questions on any amateur
radio license test. The VEC Question Pool Committee does.
By LAW the VEC QPC is composed of radio amateurs.

2. The FCC does NOT mandate the maximum number of questions
on any amateur radio license exam written test. The FCC
specifies only the MINIMUM number of questions. The VEC
QPC can generate as many questions as it cares to.

3. At some point a LARGE number of questions could defeat
even the most eidetic of humans, thereby destroying your
rant of "it isn't a real test because all can memorize
the questions-answers."

>>So all ham radio is is Morse Code on HF? Or is it more than that?
>
>It's a lot more. The question isn't what ham radio is, it's whether
>one should be required to pass a realistic test to get a license.

"Realistic test" = Collitch-level BS to make one a 1930's
radio expert? :-)

Define "realistic test" remembering that ALL the VEs are
also VOLUNTEER radio amateurs.

>>> I don't remember after almost 50 years - but I could still draw them
>>> today, and it's not a test of remembering what's on the test, it's a
>>> test of knowing what's in a radio.
>

>test.

Oh, my, are you taking on the ENTIRE Academic Community now?

Last college-level course test I had required MEMORIZING
and WRITING THEM DOWN! Damn, all that work leading up to
it and it wasn't a "real" test!

>> You'd probably be weeded out pretty quickly.
>
>I doubt it - if I couldn't pass an Extra theory exam - a real one, not
>the nonsense that passes for one these days - I'd lose my job in a

[getting Donald Trump wig] "You're fired!" :-)

So, Al, what did you get for a license? A BS-HAM?

Define "real test," show your work.

>What if you addressed what I said when you answer me? Your dishonest
>tactics are transparent.

WHAT "dishonest tactics," olde-tymer?

You've gotten rather self-righteous about "real" without giving
any real answers as to what defines "real."

You got stomped on, par for the newsgroup course. If you don't
like disagreements over your disagreeability, try another venue.

>Quit putting words in my mouth. I wasn't complaining to anyone, and
>we weren't discussing remembering 50 year old tests.

You WERE COMPLAINING...all about "today's tests are not 'real'".

Self-righteousness is readily transparent...

>>But if a practical exam is necessary for Morse Code, why isn't it
>>necessary for other modes?
>
>Maybe we should have one - show the ability to put a clean PSK signal
>on the air. Show the ability to interpret a waterfall display. Show
>the ability to tell the difference between various digital modes. The
>bands would be pretty QRM-free.

You did NOT answer Brian's question.

Does self-righteousness negate having to answer questions?

>So you're in favor of exams that test knowledge of theory? "Draw the
>schematic of ..."? "Explain why long path 2400 bps is impossible on
>14 MHz"? That kind of relevance?
>
>Or the "pick the answer with the resistor like we showed you in the

>example" kind of relevance?

Now you are putting words in Brian's mouth. Tsk, tsk.

Explain how the VEs will love and embrace your collitch-level
AMATEUR radio license exam, needing hours per test applicant.

In case you hadn't been up to speed, the FCC does NOT normally
do any testing of either Commercial or amateur radio licenses.
That's been privatized.

If you wish to change AWAY from privatized testing, you have
ready access to the Proposal method with the FCC. They explain
the whole process.

>>> All you
>>> have to do now is memorize a few answers.
>
>>That's all you had to do then.
>
>How do you draw a schematic and explain the functions of parts by

>or "coil".

Gosh, olde-tymer, did the ham exams of a half century ago get
into vectors and phases? I had none of that in my First 'Phone
exam. I missed a collitch-final kind of exam? :-)

>>> >I used radios in the military. I never used a CW key in the military.

>>> >power once.
>
>>> But you had to learn how to use the radios.
>
>I did?
>
>They just gave you a radio and said "use it"?

Soldiers and Airmen weren't "given" radios. They were ISSUED them.
A half century ago you had damn well take CARE of them or you HAD
to pay for them! By the way, the FCC does NOT regulate federal
government radio use...the NTIA does that, for both federal folks
and military personnel use.

I can give you a brief summation of the "instruction" in using
an AN/PRC-6 HT: About 10 minutes, word of mouth and hands-on
"training." A VHF radio transceiver, it wasn't designed for
AMATEUR radio activities. It couldn't be...didn't have any
place to plug in a code key. :-)

I can easily remember the "training" on lots of other real radios
in the military plus a few more as a civilian working on DoD
contract projects. The AN/PRC-119 took a lot longer, especially

for the Hopset entry. [I had to learn it from its big TM] You
familiar with the PRC-119? A quarter-million of them have been
built. All the military branches have them.

>When I was licensed you had to show an understanding of theory, by
>answering questions that were more than just multiple choice from a
>published answer pool.

Sunnuvagun! In 1956 one of the four parts I successfully
completed was MULTIPLE-CHOICE! How about that? :-)

But that was at an FCC Field Office. 80 miles away in Chicago.
No "conditionals" for Commercials then, senior. "Privatized
testing" would be a laughable subject in '56. :-)

>>> >I've listened to emergency responders on a scanner before. They don't

>voice commo, not in Morse.

I have no problem with understanding Brian...and I HAVE been
around radio communication for a rather long time. Try asking
me about "efficiency" or "throughput" on any mode, any radio
service.

Can you explain where all the other radio services got their
"training" in radio use? If any at all, that is. You can't
find any other radio service users who get NO "training"
whatsoever nor need anything but an equipment license to use
it? [I'm not talking about CB]

>> If you must retain a Morse Code Exam, then you must
>>also administer practical exams for SSB, FM, AM, FSTV, SSTV, RTTY
>>(which is pretty darned old), packet, PSK, etc.
>
>I have no problem with that.

I daresay a whole bunch of VEs would argue with you after
spending HOURS separately with each test applicant for
one of those "realistic test" ideas of yours.

>I'm advocating real testing for whatever mode. Right now the only
>test is "do you have the fee, can you get to the testing place, and
>have you memorized enough answers to pass". Let's have a test that
>shows whether the testee knows anything. CW, APRS, AX25, PSK - all of

>it. Or separate the licenses. You want to operate FM, you take a
>test on FM and, if you pass, you get an FM license. Want to operate
>SSB, you take a different test.
>
>Not "want to get on the air? memorize some answers and pay your fee".

Tsk, tsk. Plan out a "real test" and then get an estimation
of the TIME it would take for each VE and each license
applicant. Remember that US amateur radio licensing is now
an ALL-VOLUNTEER process. Just WHO are you expecting to PAY
for all the equipment necessary to do your "real testing" on
ALL modes now allocated to US radio amateurs? Government?
VEs? Who will be responsible for their maintenance?

[this group has ALREADY beaten that subject to death in here]

You will have to Petition the FCC for a drastic change in
the number of "endorsements" to the various parts and classes.
You will have to get in touch with the VEC QPC to change the
number of written test questions.

I don't think you will do anything, just sit in here and blow
off steam like the usual self-righteous Olde-Tymer. Geez.

US amateur radio is "working DX on HF with CW." Know CW and
you don't need any theory or other BS. Ipso facto. [or
something fancy in Latin to show 'book-larnen'...:-)]

On the contrary, the Conditional was the General Class
license given away from an FCC office. At the time I got
mine, the distance from an FCC office was set at 75 miles.
Quoting the 1957 ARRL License Manual: "The Conditional
Class license conveys privileges identical to those of
the General Class ..." which incidentally at the time,
was all amateur frequency operating privileges.

Dale wanted to know what frequency my "beacon" operates upon.
I was only responding. CW is best for weak signal ops, but I wanted
an AM test source for ongoing receiver experiments. Sorry if the AM
causes you any distress, but such is life.

Terry

==========

Frank,

Radiating efficiency is of secondary importance. It does not change
very much with length of radials except at very short lengths.

If computing efficiency involves great labour then do it at infrequent
intervals.

What IS important is the input impedance of a collection of N radials
versus length, frequency and ground characteristics. From which
efficiency can be calculated if required.

I know not, and do not need to know, the details of how you use NEC4.
I think it is safe to assume NEC4 provides reasonably correct answers.

After all, the primary purpose of NEC4 is to generate radiation
patterns from highly suspect input data. And I'm sure approximations
are involved somewhere. When a camel is designed by several
committees in succession, who knows how many humps can appear?

I am about to delete all contents of these threads. I look forward to
seeing a message from "Frank's".

Reg, G4FGQ.

C'mon, Todd. He qualified it by saying "4.75 mW to an isotropic antenna in free space." It is just a way to get a "feel" for how much power might be required based on the FCC uV/m limit under certain theoretical conditions.

I would start with a calculation like this if I were designing a transmitter whose signal has to meet those limits. I think that would be better than starting with a 1000W transmitter when only a few milliwatts is required.

When was the last time you used an isotropic antenna? How was your trip to free space?

John

You are wrong about the FCC limits on 13 MHz. There is no mention of 10,000 uV/m. Here are the limits:

Sec. 15.225 Operation within the band 13.110-14.010 MHz.

(a) The field strength of any emissions within the band 13.553-

13.567 MHz shall not exceed 15,848 microvolts/meter at 30 meters.

(b) Within the bands 13.410-13.553 MHz and 13.567-13.710 MHz, the

field strength of any emissions shall not exceed 334 microvolts/meter at

30 meters.

(c) Within the bands 13.110-13.410 MHz and 13.710-14.010 MHz the

field strength of any emissions shall not exceed 106 microvolts/meter at

30 meters.

You are also wrong about the power level required to achieve these limits.
The power required is much lower.

Cheers,
John

There appear to be two sets of part 15.225 rules floating around.
<http://frwebgate.access.gpo.gov/cgi-bin/get-cfr.cgi?TITLE=47&PART=15&SECTION=225&YEAR=200
1&TYPE=TEXT>
shows:
"[Code of Federal Regulations]
[Title 47, Volume 1]
[Revised as of October 1, 2001]
>From the U.S. Government Printing Office via GPO Access
[CITE: 47CFR15.225]

[Page 726]

TITLE 47--TELECOMMUNICATION

CHAPTER I--FEDERAL COMMUNICATIONS COMMISSION

PART 15--RADIO FREQUENCY DEVICES--Table of Contents

Subpart C--Intentional Radiators

Sec. 15.225 Operation within the band 13.553-13.567 MHz.

(a) The field strength of any emissions within this band shall not exceed 10,000 microvolts/meter at 30 meters.
(b) The field strength of any emissions appearing outside of this band shall not exceed the general radiated emission limits shown in Sec. 15.209.
(c) The frequency tolerance of the carrier signal shall be maintained within <plus-minus>0.01% of the operating frequency over a temperature variation of -20 degrees to +50 degrees C at normal supply voltage, and for a variation in the primary supply voltage from 85% to 115% of the rated supply voltage at a temperature of 20 degrees C. For battery operated equipment, the equipment tests shall be performed using
a new battery."

And
<http://www.fcc.gov/Bureaus/Engineering_Technology/Documents/bulletins/oet63/oet63rev.pdf>
Also shows the 10,000uV/M at 30M

Yet <http://www.sss-mag.com/pdf/part15-91905.pdf>
Dated sept 2005, shows the limits you quoted.

What is troubling is the FCC has different specs on different documents at fcc.gov.

Buy regardless of runinng 10,000uV or 15,848uV, one does NOT need a 100W
transmitter to reach either of these levels. I have a 2W unit followed by a step attenuator
coupled to a bufffer with a Zin of 50 Ohms and a Z Out of ~500. The buffer transistor
is a 250mW and isn't even warm. This was the only easy way to allow the attenuator
to accurately step the power level down. By the 15,848uV I guess I could increase
my power from 5,000uV, to allow for the energy in the sidebands, to something like
10,000uV.

Oh whoopy gea!

Too much trouble to even think about changing as I had to back the exciter down to something like 1/2W to reach the 5,000uV level.

Crystal Oscillator-buffer#1-amplifier-?20dB pad-step attenuator-buffer#2-matching-
very poor radiator.

I would guess I am running maybe 5mW into a modified CB ground plane antenna.
Serious mismatch, but my "beacon" was only intended to reach about 1 mile.
For an S2 reading I had to back the power down ~50% from max legal. So assume I am running 2.5mW with no attenuation, so for extra credit, what is my
power level at -63dB?

Terry

The first reference above appears to have been published in 2001. I can't
tell the publication date of your second reference.

Personally, I would take the 2005 publication date as gospel.

If BPL is so viable why is it only being deployed in metropolitan areas where Cable and DSL is available. It was sold to the FCC as a cheep way to provide high speed access to people outside Cable and DSL service areas. Right now is is in direct competition with those modes and the country bumpkins are left out again. This situation is similar to when the major power companies refused to extend their lines out into the country to farmers. Their excuse was that it would cost to much for each customer to make money. It took the Rural Electrification Act to create the REMC power companies. Now the big power companies what to take over the REMC's.

As I understand, repeaters costing many thousands of dollars are
needed every mile or two along the electricity line to shoot the BPL
signal on along. There's not enough population density out in rural
areas to justify the cost.

Bob;

That wasn't mentioned when BPL was first proposed.

Dave

There was only one ship in orbit in "Independence Day", the mother ship.
All of the other ships that detached from the mother ship, the daughter
ships, so to speak, were all within the Earth's atmosphere. That is why
the satellites were necessary to overcome the line-of-sight problem
between the mother ship and the daughter ships on the opposite side of
the planet.

Close...

Whilst anything is possible, the chipsets implemented and being
commonly deployed need a repeater at much much smaller intervals, eg
the DS2 chipset needs repeaters typically after about 80 metres
(~260').

The promotion of this as a total acccess solution to rural subscribers
is misleading and dishonest, the potentially profitable market is in
residential areas and triple-play more than very low density rural
rollout.

earth is the only earthlike planet with a heavyside layer effect and in
centuries these folks never developded the tech to mach WWV (the time
station?)

it was nice movie even I as deadicated a Nododer as they come enjoyed
the ending

See www.amsat.org

I'm a life member.

The best book to get for beginners is the ARRL's 'Satellite Experimenters Handbook.'

Satellite antennas don't need to be high. Mine are at 20 feet, just high enough to peek over the ridge line of the house when the satellite is on the horizon.

As far as the compass direction question goes, what is your latitude, and just how much blockage will you have in the direction you loose?

Satellites could be anywhere in the sky relative to your location if their inclination is greater than your latitude.

73 & hope to hear you on the birds soon.

I'll try to copy a few of those beacons. Maybe there is info on about the
stations, and possible they have a waiver for an increase in power or
antenna size.

Some invaders. They couldn't invade a race that hadn't progressed to
the satellite stage yet.

Suspension of disbelief aside, it was a pretty good movie.

Frank,

If what you are saying is that efficiency is the same for both 36 and 120 radials, then, at least at 8 MHz, B,L&E's findings for LF do not apply at HF.

Amateurs do not use LF. They use HF.

Reg.

That's the revised version updated in 2006, the old version was 10,000
uV/m @ 30 meters.

Hello,
Please forgive me to disturb you. I know that you are fond of playing golf. I would like to share with you the joy of playing golf and introduce myself to you.
I live in Guangdong province of China. Playing golf is also my favorite. I often watch the American golf match in my spare time. I almost go play golf every week.
Because of the cheap labor force and rich resources in China, 90% of the world's golf equipments are produced in China. So the products are much cheaper than those in your country. I find the value of life from playing golf. I run a golf trading company engaging in the export of the world's famous branded golf products. We mainly produce two types of golf: copy club and installed club.

Firstly, copy club means the shaft and head of the club are produced by our factory. But they are certified products. It is hard for the beginner to identify both of them. The price is 25% of the market price.Such as TaylorMade 580 (complete club set including 13 chubs) 3woods+9iron+1Putter+ TaylorMade cart bag is $490 (including carriage), TaylorMade R7 425(complete club set) is $480 ,Callaway x-18 (compete club set) is $480 ,Callaway X-TOUR (complete club set) is $480 ,Callaway big bertha (complete club set) is $480. (All prices include shipping and handling)

Secondly, assembly club is the product which is assembled with the certified shaft, head and grip which we purchase from other factories. And it is assembled by our more than 100 staffs and advanced equepments company.It is delicately assembled and packaged. So it is like the certified one in terms of material, weight and swing as well as the feeling of playing it . Even those who have played golf for more than years feel difficult to tell the difference. And the price is just 50% of the market price in in your country. Many foreigners are amazed at the products after using them. Such as TaylorMade 580 (complete club set) 3woods+9iron+1Putter+ TaylorMade cart bag is $890 (including carriage) TaylorMade R7 425(complete club set) is $880 ,Callaway x-18 (compete club set) is $880 ,Callaway X-TOUR (complete club set) is $880 ,Callaway big bertha (complete club set) is $880 . (All prices include shipping and handling)

We could provide the world-famous clubs. Please contact me by email samgolfclub#hotmail.com or MSN Messenger if you need any type of our products. I will make a good quotation to you.
It is more than promoting the products to you this time, what's more important is to make friends with you and share with you the cultural difference of golf between China and in your country well as the

potential business opportunity. I am looking forward to hearing your own opinion of golf. Best wishes.

Yours sincerely
Sam wong

HI

I was wondering in general, how best to create some VERY effective shielding between some equipment

for example, I wanted to stack my powersupply ontop of a tuner

while each are in metal enclousures and properly"" grounded i wanted to go further

what is the best way?? would a thin sheet of lead (i'd encase in a rubber coating) or a sheet of copper?

or would the only way be to say get some copper tape and wrap the unit?

thanks

You denigrate the resistor code.

>

Your question makes no sense. What is the reference level? 1 watt, 1 mW, 5 mW, 2.5 mW?

.5 microwatts is 63 dB below a Watt.
.5 nanowatts is 63 dB below a milliwatt.
2.5 nanowatts is 63 dB below 5 milliwatts.
1.25 nanowatts is 63 dB below 2.5 milliwatts. (Is this the one you want?)

2.5 milliwatts is 3 dB below 5 milliwatts.

See a pattern in any of this?

The first and most important step is to heavily filter all conductors entering and leaving both units. This is important because all wires act as antennas, efficiently radiating and receiving the interference -- it doesn't matter how good the cabinet is if you have ways for interference to get through it. Filtering can be simple or difficult depending on what lines you're filtering, and doing a really good job requires considerable skill and knowledge. For the tuner, you can't filter the differential antenna current at the frequencies you want to receive, so you'll have to put it far away and heavily filter the common mode current.

In addition to heavily filtering all conductors entering or leaving, you need to enclose each unit in its own secure box. Any decent conductor (e.g., copper, aluminum, or steel) will do for MF and above. The important thing is that it can't have any holes or slots except small ones, and even those will degrade the shielding. This means that all seams have to be sealed with multiple screws or rivets and/or RF gasketing material. Any large holes like one for a meter should be covered with screen which is solidly connected all around its perimeter.

Those are just some of the basics. EMC is a challenging discipline, and doing a really good job of isolation generally requires skill and knowledge beyond that which most amateurs have.

Lots of memorization was required in your day. It's only a bad thing
in 1992 to present. I think I get your drift...

> >That is not true. You wish to change the written exams, not add

Prove it. Show me the exams for all the other modes.

> The question isn't what ham radio is, it's whether
> one should be required to pass a realistic test to get a license.

Yes!!! A realistic test.

> >> No, I'm not addressing *where* the test is held at all - I'm

Mmmm. I see. You are a careerist in the electronics industry and it
pisses you off that hobbyists have equal "status" as you in amatuer
radio. I've run across a lot of that in the past 20 years...

> >> >> From scratch. Let's see how many people could do that today. A

Correct. "WE" weren't discussing it. YOU were. YOU were discussing
how you can't draw what you can't remember.

> >> >> They're still as relevant today as they were 50 years ago.

YES!!!

If you are ever going to save your beloved Morse Code test, this is the
only way you're going to do it.

> > If all radio is merely plug and play, why do the services still have radio schools
>
> That's my point, not yours.

No. It's MY point.

> Or don't you understand what you just said?

I think it is you who don't know where you're going with this
discussion. It's gone beyond your having grief over your favorite mode
to actually having to think about the future of the service.
Conggrats. Another couple of years of RRAP tutoring and you just might
become a rational being.

> >> Oops, that's right - no more relevant testing, isn't that what people

> >argument!
>
> So you're in favor of exams that test knowledge of theory? "Draw the
> schematic of ..."? "Explain why long path 2400 bps is impossible on
> 14 MHz"? That kind of relevance?

Sure. But you have to ask yourself one question. Can the average VE
administer such an exam? If not, can your average GS-7 FCC employee
administer such an exam? If you set up an exam that only an engineer
can administer, then your government isn't going to accept it. So be
realistic in your zeal.

> Or the "pick the answer with the resistor like we showed you in the
> example" kind of relevance?

The exam can be anything your VEC wants it to be. We learned this when
the ARRL went from administering a Morse Code Exam at 5WPM to
administering a Farnsworth Exam at 13-15WPM.

You got me there.

And today's exams still provide that "theory" though they don't prepare
you to actually operate a radio - never did.

> >> All you
> >> have to do now is memorize a few answers.
>

On/Off and PTT. What else is there???

Oh, yeh, a magnetic compass and a chart where the satellite is.

> >> Hams today don't - they

> >also administer practical exams for SSB, FM, AM, FSTV, SSTV, RTTY
> >(which is pretty darned old), packet, PSK, etc.
>
> I have no problem with that.

Then go for it.

It is the ONLY legitimate recourse you have for retaining the Morse
Code exam.

Best of luck.

> >> >> So you'd get a license not knowing CW, build a radio (you couldn't buy

Are you drawing a pension from it? "Was."

Are you drawing a paycheck from it? "Is."

And it's so typical for Old Timers to forget that not everyone in the
ARS are CAREERIST PROFESSIONALS. Bitching and Moaning about how
everyone else doesn't know as much as them.

> >> >> What next? DXCC awards for those who *want* to work 100 countries?

> I'm advocating real testing for whatever mode.

Finally!!! I hope you won't hold it against me for badgering you into
such a position.

> Right now the only
> test is "do you have the fee, can you get to the testing place, and

> have you memorized enough answers to pass".

Welp, other than "can you get to the FCC office" things sure haven't changed much in 50 plus years.

> Let's have a test that
> shows whether the testee knows anything.

Remember that you are handsomely compensated for your professional knowledge. Amateur Radio is a non-compensated hobby.

> CW, APRS, AX25, PSK - all of
> it. Or separate the licenses. You want to operate FM, you take a
> test on FM and, if you pass, you get an FM license.

Endorsement. Remember - your VE has to be smart enough to administer the exam.

> Want to operate
> SSB, you take a different test.
>
> Not "want to get on the air? memorize some answers and pay your fee".

And get a vanity license plate.

You are awesome. You're finally catching on.

Who say an old dog can't learn new tricks?

To clarify, the test was given >at a distance< from an FCC office.

The license was not "given away."

General/Conditional Class = "All amateur priveleges," as in AMATEUR
EXTRA priveleges.

You could well be correct Reg. I will get back to B, L & E's paper
and see if I can obtain some correlation between the measurements,
and calculated results At the moment I see 2.5% improvement
between 36 and 99 radials at 8 MHz.

What has also been throwing me off track for a while
was the fact that the input impedance of the 99 radial antenna was less
than than the expected radiation resistance of 36 ohms.
I used this assumption on all my previous
results, so they may have some errors. Applying this technique to the
99 radial antenna would lead to a real resistance component of less than
zero.
Cebik's analysis of buried radial monopoles (www.cebik.com) also
corroborate my findings. Based on the total radiated power, (40% of input)
including surface wave, the radiation resistance is closer to 14 ohms.

The very first thing to do is to stack the PSU on top of the tuner and
check to see if further precautions are really necessary.

I very much doubt that they will.

If there IS any interference, it will be picked up wherever in the
shack the boxes are placed and the only solution will be to change the
type of power unit.

Once again I see why I should not take up comedy.
It wasn't a serious question.

I was reffereing to 5mW at 50 Ohms.

One of the definitions of "away" is "distant". The
Conditional exam was given "away from" the FCC office.

At HF most of the interference you're going to get from box to box is either conducted along some wires connecting them or radiated by some large metallic structure (the power cord, the house wiring, etc) that is connected to wires coming out of the boxes and then picked up by the antenna.

Although Roy has excellent points about what you need to do to get solid EMI shielding, you can do a lot without plugging the holes in the boxes.

Reg is right about the first step. Do you need extra measures at all?

The second step is plugging the BIG leaks, which would involve doing things like filtering the unshielded cables coming in and out of things (ferrites on the power cord, for example). Your boxes already have some shielding by virtue of the fact that they're in metal enclosures (I assume).

If you are having problems with, say, a switching PSU and you think it's leaking in to the tuner, try this. Replace the antenna and feedline with a good, shielded dummy load. Then see if there's any change in the noise in your RX between setting the PSU on the tuner and setting it elsewhere.

Dan

Even TODAY'S tests are not the same ie; Answer A in your study guide will cooresponding to Answer A on the exam. ANYONE "memorizing" those answers is nothing short of a FOOL. It is far better to read that book for what little it is worth - for what it will "TEACH" you to understand - thereby making passing the exam almost a done deal. UNDERSTANDING AND REMEMBERING (Memorizing if you will) the BASE material is what gets you through.

As the man said, at one time - there were no SET of exams. If you had no clue of electronics or rules and regulations where it came to Ham radio - you were "guranteed" to fail in front of the FCC. Often - that meant a long trip. Even at that - tests today - most VEs have at least 3 - 5 sets of exams per class. OR you could be given a test via computer which is randomly generated. So, to "memorize" ABCD just isn't going to cut it.

As I said before - ya got to memorize many things to get through life - your SS number, your birthdate, your name, how to spell, read, write, add, subtract, driving a vehicle, etc..... the list goes on - SURELY you didn't "memorize" a simple ABCD answer for MOST of that! Memorizing your SS number, name and birthdate may equivalate to the ABCD method, but - when you were tested in school for subjects - you had NO clue what was to be asked. If you didn't pay attention to what was being taught - you most likely bombed the test.

Again - we're splitting hairs here on the word "memorize". You can "try" to memorize ABCD to pass a test without studying (and hope the test conforms to the pattern you "memorized") OR you can MEMORIZE IT BY STUDYING it - (committ it to memory for life) -therby understanding the principles and

being able to "honestly" answer the questions based on "knowledge" of the subject.

I seriously do NOT understand the hang up on this issue. Maybe "I" am missing something - but it seems to me, I had to memorize (LEARN) a whole list of shit to be able to function in a meaningful life. Your mind is like a computer - you have to program it (study) - to learn things TO MEMORIZE FOR LIFE. Simply trying to recall ABCD on a test without understanding the concepts - you're still going to be dumb as shit even if you do pass. Wouldn't you rather "know" what you're supposed to know? Sure makes one look a bit more inteliigent.
Maybe that is why so many people are so goofy on the highways - they "memorized" answers to the test instead of actually "learning" what the principle were/are. Makes sense to me! For those of you who parachute or do other "life endangering" tasks - I'd sure hate to be you - depending on someone who simply "memorized" ABCD on a test as opposed to "learning" the requirements to fulfill the task.

No wonder this world is so screwed up..... TOO LAZY TO "LEARN".

L.

It is true that the 1950's License Manuals were not multiple
choice but the exams were. The License Manuals went like this:

Q: What is the unit of electrical resistance?

A: The unit of electrical resistance is the ohm.

The exam then had multiple choices, one of them being "ohm".

It is hard to understand how anyone could develop that correct
answer from first principles or formulas. I memorized the
correct answer and it still exists in my memory as something
I once memorized long before I ever knew there was a man named
Ohm after whom the unit of electrical resistance was named.

The difference between memorizing the question pool answers
from the 1950's License Manuals and memorizing the question
pool answers of today is just splitting hairs. I used exactly
the same memorizing techniques to ace the Extra exam in
2000 as I did to pass the Conditional exam in 1953.

the issue is simple some folks want to claim other folks that took and
passed the tests equire by by law are somehow "cheating"

Reg,

The K3LC study is probably the most definitive look at radials since BL&E. The following URL takes you to the *.pdf file wherein they evaluate radials under various soil conditions, on 160/80/40 meters. They used NEC-4 for their study. This is the study that resulted in the "radial optimization" formula that several of us have referred to.

http://www.ncjweb.com/k3lcmaxgainradials.pdf

Since this is all NEC-4...it should compliment what you are having Frank do.

Here is the formula info:

(This formula is from both QST and Low Band Dx'ers Handbook by Devoldre)

Obviously a ton of short radials does not equal a ton of long radials, but it can get you really close. See the articles for limitations of the formula. Don't use the formula like this: Gee, I only have 200 feet for radial wire. It will give you the right
answer....but...when you only use so little total wire, your losses will be quite a bit worse than the 0.5 to 1 dB that was the goal of the studies.

The formula goes like this: (wire length in meters)

N = ((2*PI*W)^0.5)/1.2

N equals the square root of the quantity (2*PI*WireLength) divided by 1.2

Where N = number of radials

Where W = length in meters of available wire to make the radials

Length of radials = W/N

and the constant 1.2 is the tip separation in meters to produce the proper density on 80m ..this would be twice the density one needs for 160m and half what is needed on 40m. The value for minimum tip separation is simply .015 wavelength. So if you calculate a full wavelength for the freq in use, multiply it
by .015 and that gives you the value for tip separation in the formula above. For 80m it is 1.2 meters

Example:

You have 500 meters (about 1640 feet) of radial wire available for your 80m vertical. How many and how long should the radials be:

46 radials, 10.8 meters (35.6 feet) will produce the lowest possible loss
for this amount of available wire.

This is a simple formula for how many radials to put down if you have
"only so much wire". These days with copper prices through the roof, it pays
to be economical and still stay within 0.5 to 1 dB of "what's best".

Guys:

FYI...

Walt is correct. This "rec.radio.amateur.antenna" USENET NG (aka "rraa") and many other newsgroups redact any graphics, attachments or inserts associated with NG posts, allowing only text to be posted. This practice is followed of course in the interests of both memory and bandwidth conservation at the "free" USENET servers. No one running USENET servers makes money!

However, a number of years ago a special USENET newsgroup was set up by USENET volunteers in the "alt.binaries" area, to be used for short term postings of graphics content related to electronics such as schematics, etc...

There are a couple of minor problems associated with this approach. (1) For one, the biggest problem is that not all ISPs actually carry the "alt.binaries" groups due to either, server memory limitations or, because several (many?) alt.binaries groups carry pornograhic graphics. (2) The second small "problem" is that, again for reasons of memory conservation, the "turnover" of postings on those graphics/binaries groups is fairly high. That is postings are cycled through fairly quickly, usually with availability of only a week or so. And so one should surf on over to the alt.binaries group quickly to view or download any desired postings.

All that said however, ya'll should find that "alt.binaries.schematics.electronics" (aka "abse") is a good place to post drawings, schematics, block diagrams, photos and other graphics content related to electronics and antennas, etc.

The usual procedure in the "electronics" groups such as "sci.electronics.design" (aka "sed") is to mention that the graphics/schematic referred to in your postings, has been posted on the other NG that accepts graphics/binaries.

For example lots of the folks who hang out and discourse on: "sci.electronics.design" (aka "sed") post their schematics, block diagrams, photos, etc... to "alt.binaries.schematics.electronics" (aka "abse").

There is no reason why the denziens of "rraa" cannot post their antenna graphics on "abse".

Sign up for abse and... Go for it... just do it!

Hope this helps. :-)

1987. Re: Rule of Thumb for coax chokes

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-11 18:20:57 UTC
From: Cecil Moore <mycall@hotmail.com>
Message-ID: <dU3Dg.6376$kO3.1950@newssvr12.news.prodigy.com>
Source record: 54924

Reg Edwards wrote:
> Let us know when your rule-of-thumb is available from your website.
> I'm looking forward to seeing the details.

The rule of thumb is pretty simple and is for 2L pop bottles.
Wrapping at 2 turns per inch (RG-213) around a 4 inch diameter
pop bottle, the optimum number of turns for a particular band
is equal to the numbers of meters in a wavelength. In other
words, use 40 turns on 40m, 20 turns on 20m, and 10 turns on
10m. It's not actually linear - just a rule of thumb. It is
most accurate around 20m-17m.

> I guess there will be the usual collection of over-meticulous
> nit-pickers.

Well, here's some data points that will probably surprise you.
I don't have a pop bottle so I am using a Quaker's Oats box
for a coil form. It is 5 inches in diameter which makes the
diameter of the coil using RG-400 about 5.4 inches. I wrapped
8 turns at ~4 turns per inch. My EXCEL spread sheet indicates
that coil is 1/4WL self-resonant at about 22.5 MHz making it
a good choke on 15m. Doubling that 1/4WL self-resonant frequency
to estimate the 1/2WL self-resonant frequency gives 45 MHz.
Now brace yourself.

The series impedance of that choke falls below 650 ohms at
about 27.2 MHz. 650 ohms is the maximum impedance that my
MFJ-259B will display. The choking impedance is never again
higher than 650 ohms as frequency is increased. It goes to
a minimum of 49 ohms at the 1/2WL self-resonant frequency of
45.6 MHz. Note that is reasonably close to double the 1/4WL
self-resonant frequency of 22.5 MHz *calculated* by my EXCEL
spreadsheet and by the BASIC program that I sent to you.

There is a one-wavelength self-resonant point at ~88 MHz and
a 1.5WL self-resonant point at ~122 MHz.

These measurements seem to prove that the coiled coax choke
acts more like a transmission line than like a lumped
inductance. Conclusion: A coiled coax choke designed for 20m
doesn't function very well on 10m or at any higher frequency.
(A coiled coax choke designed for 10m also doesn't function
optimally on 80m.)

==========
Hasan,

Thanks very much for the formula of which I was entirely unaware. I
will study it.

I notice that it disregards resistivity and permittivity of the ground
under under the antenna which, obviously, ought be taken into account
even when only crudely known.

There's a great difference between a soil resistivity of 25 and 5000
ohm-metres.

This is similar to BL&E who simply state that if the length and number of radials are greater than certain amounts then soil characteristics don't matter.

Reg.

Cecil,

What makes you think your EXCEL spread sheet (whatever that is) gives
the right answers?

Have you ever made any measurements of the harmonic resonant
frequencies?

If so, how did you do it?

Reg.

Selective amnesia. "No one had to memorize anything" prior 1992.
Not in grade school, not in college, not in industry, not in
real life. Strange perception...

>Ummm? There's no Morse Code test anymore?

The International Morse Code test for United States amateur
radio license classes General and Extra have NEVER GONE AWAY.

That is especially true in the perception of the ARRL which
still manages to insert the "necessities" for morsemanship
in nearly everything it publishes. It's been six decades
since Hiram Percy became ultimate DX but they still keep on
with their demand that all [US] amateurs be proficient in
that old mode.

> The Conditional was whatever class was being tested for, but not at an
> FCC office. It had nothing to do with the class, only with the

>> What current exam? Memorizing answers and writing them down isn't a
>> test.
>
>So what is it that you fear?

Klein fears CHANGE and, perhaps, feelings of obsolescence.

Someone who has been a regular worker in electronics (radio is a
subset of electronics) ought to damn well know and recognize
that the state of the art in electronics has been CONSTANTLY
changing. It's sometimes a chore to keep up, whether it be
1950 or 2000 or any time in-between.

>pisses you off that hobbyists have equal "status" as you in amatuer
>radio. I've run across a lot of that in the past 20 years...

I've run across a lot of that my entire life. :-)

I think Klein wants recognition as a "professional amateur" or
"amateur professional." I'm not sure which...

>> What if you addressed what I said when you answer me? Your dishonest
>> tactics are transparent.
>
>You're the one that forgot the circuit, not me. Get pissed at your own
>self.

When in doubt of an effective reply, these Fundamentalist
Morseodists
must resort to some form of denigration. Sigh, they never learn...

>> Quit putting words in my mouth. I wasn't complaining to anyone, and
>> we weren't discussing remembering 50 year old tests.
>
>Correct. "WE" weren't discussing it. YOU were. YOU were discussing
>how you can't draw what you can't remember.

This is an indicator that Klein isn't used to computer-modem
communications. He isn't looking beyond his own screen and
understanding that others are separated from it in time and space.
"He" was obviously talking about "old days" of "His." He is not
considering that others do not share his viewpoints.

Considering the Type of Oscillator and "names," he has put
Names as somehow "essential" to the circuit. NO SUCH THING.
An oscillator is simply an amplifier of just-barely-past-unity
gain with positive feedback. The Names were tacked on by
academics long, long ago as IDENTIFICATION of the general form
of amplification-with-positive-feedback.

One can build a Colpitts oscillator, make it work, and continue
calling it a Hartley. Won't make a bit of difference to the
circuit...electrons don't give a damn about human labels. They
work by THEIR laws, not humans' with their imperative labels.

By the way, on a quick bit of checking, I've got text references
to about 11 different oscillator forms, not just two (with his
unknown third type)...and I'm not counting free-running multi-
vibrators which are also very much an "oscillator."

>> Maybe we should have one - show the ability to put a clean PSK signal

[no...]

>If you are ever going to save your beloved Morse Code test, this is the
>only way you're going to do it.

The only way to "save his beloved morse code test" is to have the
ARRL exercise some BETTER brainwashing than it has been doing for
decades. The League is still trying to use its old persuasion
and, so far, hasn't been able to get memberships from the 3/4 of
all licensed US radio amateurs who are NOT ARRL members...

>I think it is you who don't know where you're going with this
>discussion. It's gone beyond your having grief over your favorite mode
>to actually having to think about the future of the service.
>Conggrats. Another couple of years of RRAP tutoring and you just might
>become a rational being.

I disagree, Brian. Klein is a MORSEMAN. They don't change.
They are rooted in old days long gone, brainwashed early into
thinking that morsemanship is "essential" to "best" radio
communication. It isn't...easily proved by ALL the OTHER
radio services giving up on morse code as a mode (if they
had it once) or never requiring it since a radio service began.

>> >Who said that? We absolutely NEED relevant exams. That is my whole

>
>Sure. But you have to ask yourself one question. Can the average VE
>administer such an exam? If not, can your average GS-7 FCC employee
>administer such an exam? If you set up an exam that only an engineer
>can administer, then your government isn't going to accept it. So be
>realistic in your zeal.

Klein hasn't considered the simple fact that, by law, the VEs
do NOT have to be trained test-adminsters. They are simply
VOLINTEERS who have the requisite license class and GIVE OF
THEIR OWN TIME to adminster tests. VEs are accountable only
to the FCC in that volunteer testing. VEs' only "penalty"

in mis-administering an amateur test is a reduction in license
class or forteiture of their amateur license.

Klein and his "tests aren't like they were in 'my' time"
bitchers and moaners HAD their chance to keep privatization
in testing from happening long ago. Legal means to stop it
by NPRM Commentary didn't make their case. Privatization
happened for BOTH amateur and commercial licenses. Now
their whine is long past its time and has turned to vinegar.

>> Or the "pick the answer with the resistor like we showed you in the
>> example" kind of relevance?
>
>The exam can be anything your VEC wants it to be. We learned this when
>the ARRL went from administering a Morse Code Exam at 5WPM to
>administering a Farnsworth Exam at 13-15WPM.

True enough, Brian, but expect ten kinds of flak from the
other morsepersons in here on that... :-)

The VEC can LEGALLY generate a Question Pool with ONE HUNDRED
times the minimum required number of questions. With electronic
transmittal over the Internet the Question Pool can be updated
within 24 hours to ALL VE groups.

Say the FCC requires a minimum of 50 questions on a written
test element. If the VEC QPC generates the Question-Answer
pool with FIVE THOUSAND QUESTIONS (and answers), it should be
obvious that mere "memorization" sufficient to pass that
written test element is out of the question. Anyone who CAN
memorize that prodigious amount is already gifted as an eidetic
and those are extremely rare among humans.

What all that concentration on the "written tests" is about is
just a DIVERSION to keep from replying on the singular morse
code test continuation. The morsemen just haven't been able
to come up with sufficently-valid reasons to keep the morse
test (other than the emotional ones) so they smoke-screen by
bringing up the writtens. Old tactic of theirs.

[ahem..."volume" and "squelch" to name two... :-)]

>Oh, yeh, a magnetic compass and a chart where the satellite is.

Darn you "kids!" Weren't any of those newfangled gizmos
like "satellites" when I was in the Army. :-)

The AN/PRC-8 backpack VHF transceivers (one of which I wore
in PIP Training) also had VFO frequency control along with a
built-in "crystal calibrator." Nothing like the "channel
selection" of a later synthesized AN/PRC-25 (also FM on VHF).

Interesting engineering feat with that VFO control over a
military temperature and vibration environment. Copied from
the old SCR-300 "walkie-talkie" of WW2, devised by Motorola
(also FM on VHF). But, I digress, that was Practical Theory
as applied by professional engineering, used by professional
military people...didn't have the majesty of AMATEURISM and
all its nobility (and class distinctions).

>
>Yes, you had to memorize paragraphs instead of multiple choices. Big
>deal.

Good grief, all that crying and wailing over Test Privatization!
Maybe we should take up a collection to send him some Kleenex?

Seems to me that COLLEGE-level course tests that I took had a
LOT of memorization. Maybe we should all slam the academic
world for doing the same "memorization?" Hey, why not, all
those who failed college level courses can get a Wailing Wall!

My state drivers' license testing is done from multiple-choice
and that requires MUCH memorization of the applicable laws.
While the CA DMV does not publish the EXACT answers, the have
lots and lots of examples, not only well-publicized but available
free in little booklets at each DMV office. Maybe Klein wants
me to take an ME degree course in automotive engineering just
to drive our Malibu MAXX? :-)

Brian, if you check out the "official" history of the ARRL
you will find out that they BEGAN in trying to circumvent
the commercial telegram system with a relaying of messages
past the commercial boundaries and FEES. If that were
reported today, the journalists would call it "hacking."

Klein has yet to define his own label, whether it is "professional
amateur" or "amateur professional." He seems undecided.

I'm one of the (chronological) Olde Fahrts in this group but I
pray to God that I won't ever get as bad as some of them with
their retro attitudes and fixations with modes of their long-
ago youth, the ultra importance of CLASS and RANK. Geez.

You'd think that some of them regard amateur radio like the
USMC! ["the few, the ultra proud (of morsemanship)"]

>> Let's have a test that
>> shows whether the testee knows anything.
>
>Remember that you are handsomely compensated for your professional
>knowledge. Amateur Radio is a non-compensated hobby.

Some of these Olde Fahrts seem to think their amateurism is on
some kind of "higher plane" than ordinary, plebian, work.
They be BETTER than the pros and keep reinforcing each other
with that pipe-dream. After all, the ARRL keeps reminding
them of their greatness, their "service to their country"
(by having their hobby). To hear them talk the nation would
immediately fall apart without these federally-licensed
hobbyists!

We'll have to get Mr. Webster to work coming up with a better
definition of the hobby. Is it "professional amateurism" or
"amateur professionalism?" I opt for the latter but others
may differ.

Beep, beep...

Source record: 54829

I realized today doing some cursory checks on copper vs. aluminum prices that you can nearly purchase a small TIG welder with the savings of using aluminum instead of copper in a big magloop (think 10' square, 2" tubing low bander). I think it even holds true if you use larger diameter aluminum to make up for the lower conductivity of aluminum vs. copper.

Just a thought if you've always wanted to use aluminum in a large magloop but went to copper because you couldn't figure out how to get low-resistance joints in aluminum!

Yes, it can't make money without large customer base.

It is interesting, the head of the FCC has ZERO technical experience
within the RF arena, however, he holds several degrees from NC Universitites,

and is a lawyer.

Just like the FCC comm. before him, Powell and Abernathy think BPL is
the Nirvana for internet.

Would be cheaper for the power companies to run fiber cable on or under the
existing poles that carry the big power to the dist. stations.

Then they can deply wifi or other service. Or even lease the cable to other
providers.

Once the power co. can put the bpl into their rate base they can charge
customers
for the hardware even if they don't use bpl.

With luck, it will just be too expensive to even consider.

Fewer people would get confused by posts if dBm instead of dB were used
when transmit power level or receiver sensitivity is spoken. I know I
would.

dB being a relative measure should only be used when speaking of a
component like an attenuator or amplifier not a level of power and just
invites the possibility of confusing the reader.

Because it agrees within 3% of my actual measurements.
It's the same formula covered by the BASIC program
that I emailed to you.

> Have you ever made any measurements of the harmonic resonant
> frequencies?

The posting to which you are responding has three of
those measured harmonic resonant frequencies.

> If so, how did you do it?

I put the coaxial choke across my MFJ-259B terminals and
looked for low impedances. They occurred at 45.6 MHz, 88 MHz,
and 122 MHz corresponding to 1/2WL, 1WL, and 1.5WL. That
proves that the VF given by Corum's equation is correct
because it predicted the 1/4WL point at 22.5 MHz, within
3% of the measured results.

And if the Corum equation is valid for coaxial chokes, it
is probably also valid for mobile antenna loading coils.

Even with the resistor color code, most of us *MEMORIZED*
a jingle like:
Bad Boys Rape Our Young Girls But Violet Gives Willingly
I believe the military used to teach their technicians
to *MEMORIZE* that jingle. Exactly how does one develop
the resistor color code from first principles?

The issue is that if there's something wrong with the tests,
that is not the fault of the test takers. It is the fault
of the test designers. Given a person with a PhD in electronics,
50 years experience, and capable of doing 50 wpm in Morse code,
all he can do presently is pass the present day test requirements
and then be belittled by people like you who are inferior to him
in every way.

Of course I understand. When I took my Conditional exam,
I didn't know Mr. Ohm from a hole in the ground. I simply
MEMORIZED that the ohm was the unit of resistance. I
had no idea how to know that except by *MEMORIZATION*.

You must first try to stack the supply on the top of the tuner and hear
what append.

If it is HF EMC, Roy and Dan give you some advices for that.

If it is 50 or 100Hz, only mu-metal will do something. With copper or
metal, you will only get Foucault's current in the shield, and those
currents will make a new EM field on the other side of the shield.
Successive metal shields can even be a very good mean to transport at
distance a low frequency magnetic field. So, only mu-metal will be
effective in that case.

That's absolutely right, although you might get by with a good layer of steel for mains-frequency shielding. I was thinking only of RF interference. If you're having problems with mains-frequency hum from the power supply transformer's field or the field from the conductors between the transformer and the filter, you'll need some highly permeable material. Steel might be adequate, but mu-metal is better.

Mark, would you put these five steps on your web blog for me? Thanks. I
also want to try to get the moon bouncers to help us out. I think by
puting the five steps on your website, a lot more hams will see and agree
the five steps are a good idea. TNX, 73

SC

Step 1: No more automatic renewals. Individuals must retest and
pass all elements required for their license class.

Step 2: The passing score for written exams needs to be raised to 85%.

Step 3: Code elements should be 13 wpm for General, and 20 wpm for Extra.

Step 4: Make the no-code license one year non-renewable.

Step 5: Cancel your league membership until they decide to work
to improve things.

2013. Frequency Sensitivity of mobile HF vertical antennas.

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-12 00:05:58 UTC
From: Dave <W1MCE@comcast.net>
Message-ID: <5YmdnXbPd7P7hkDZnZ2dnUVZ_u6dnZ2d@comcast.com>
Source record: 54850

My setup is Hustler MO-2 with center loading coils and top stinger [appropriate for each band].

For the sake of this discussion I'll refer to my 60 meter antenna. The antenna is tuned to resonance at 5.3715 MHz using an MFJ-259B. Adding approximately 4 inches [small spring for coil strain release] immediately below the coil and at the top of the MO-2 has negligible effect on resonance [a few KHz]. Now, varying the stinger above the loading coil by 4 inches causes very large changes in resonant frequency of over 300 KHz.

What's happening in the world of Antenna Physics to account for the change in sensitivity as a function of position above or below the loading coil?

Having asked the question, I'll slide back into the internet ether, wait for sunspots to improve, and read the opinions and comments that follow.

2014. heating pad<RFI?>

Would a heating pad cause RFI ? My wife has intermittent back problems and when she uses her heating pad it seems I get spikes of RFI on my AM reciever. I'm assuming it's that. I can't seem to track anything else that may be causing it.Thanks in advance,
Will

That's distinctly possible. Almost any load on the powerline can
create RFI (either radiated or conducted) if its load-switching
circuits cause sudden current changes on the line.

It's possible to build AC power-switching circuits which minimize
current transients and thus minimize radiated EMI. If I recall
correctly, good ones will switch on when the AC voltage crosses
through zero, and switch off when the AC current passes through zero.

Your wife's heating-pad controller or thermostat may very well have a
cheaper switching circuit which pays no attention to the powerline
phase. If so, it'd probably generate a short spike of noise whenever
the heating current was turned on or off.

You could try plugging the pad into a good AC power-line filter,
and/or using a snap-on ferrite or two on its power cord (wrap the
ferrites in soft flannel :-)

I don't know the "Q" of your particular antenna, but changing the whip
length will definitely have an effect! The voltage portion of the antenna
(bottom) won't make much difference, but the "current" (amperes of RF
current) will make a difference because we "tune" to resonance to match
frequency, and the coil and whip are what control that. Maybe I don't
explain it very well, but, I am sure others will elaborate! :)

What are the pro's and con's of lengenthing a mobile antenna? I have a travel trailer that I would like to operate from with a mobile vertical antenna off the back bumper. I standard 8' Huslter type mobile antenna would be poor with most if its length running parallel the back side of my aluminum framed trailer body. Would it be benefitial to add about 15 or so feet of mast to the antenna below the coil? Would an additional 15 feet of mast below the coil prevent me from tuning to resonance with the adjustable whip on top? If so, any suggestions as to materials to do so?

PS: I'm only planning on operating 75M and maybe 40M.

Yes, it sure can cause RFI, but it will generally be relatively short lived and periodic.

If the thermostat in the pad is a simple bimetallic strip and doesn't have significant "snap action" the contacts will tend to have lesser contact as the temperature rises to the set point. This lighter contact can cause less than perfect electical contact between the contacts, creating RFI that is quite severe, until the contacts actually open. This can last several seconds, depending on the thermostat. A similar, but less significant problem can happen as the contacts close.

I get a very similar high level RFI noise just before the water pump on the house I'm renting is about to switch in. The noise begins at a low level, then increases to maximum over about a half second, and continues for three to ten seconds, until the pump finally starts. Once the contacts make a good enough circuit to start the motor, the noise goes away. A similar noise happens with about a half second total time when the pump is about to stop. Changing the set point of the pump causes the time to vary some, and replacing the pressure switch worked for about six months before the noise returned. Happily, we should be moving into our new home in a couple of months, so can leave this pump behind.

As already noted by another poster, filtering can help a fair bit, but may not totally eliminate the problem.

On the other hand, if you are hearing longer term buzzing type of RFI particularly of a broadband nature, suspect any dimmer switches or "touch" lamps as the potential culprit...

A snubber across the contacts should stop the RFI. Try a 0.01uF 600V cap in
series with 47 ohms. If you don't have a suitable 600V cap in your junk
box, look in a discarded PC power supply or monitor. The AC line input will
have 250VAC caps for RFI filtering.

Cecil,

You have convinced me Corum's formula is in the right ball park. I have not found time to study how it has been derived. It doesn't appear to be particularly useful.

I will now tell you how to obtain ALL resonant frequencies, both 1/4-wave and 1/2-wave as you call them.

Place a single turn link winding around the CENTRE of the coil under test. Between the link winding and the MFJ-259B connect a loosely twisted pair (or a short length of speaker cable). The whole caboodle can be made from a single length of thin, insulated, stranded wire.

I've a feeling that the length of the connection should not be too long. But the 259-B should not be very near to the coil to keep the meter outside the field of the coil. 6" or 10" seems about right depending on the size of the coil. Ideally, length should be much less than 1/4 wavelength at the test frequency.

Begin at a low frequency and search for the first high impedance on the moving coil meter on the 259B. The first high impedance resonance corresponds to the self-resonant frequency of the coil.

Increase frequency to find a low impedance resonance. Continue to find the next high impedance resonance, etc.

The resonant frequencies may not be closely harmonically related.

You may not find very close agreement with the results obtained by connecting the 259B directly across the coil. But both sets of results are equally valid (or invalid).

I leave it to you to draw conclusions from the sequence of high-Z and low-Z resonant frequencies.

Greatest accuracy is obtained by using the link coupling at the high impedance resonances because the coil is then more isolated from its environment. Its environment includes the input impedance of the 259-B itself.

The lower the self-resonant frequency, the greater the accuracy.

I found a coil in the junk box, 2.7" diameter, 4.0" long, 44 turns, which has a self-resonant frequency of 13.6 MHz. I would have liked it to be as low as 2 MHz.

I agree, a coil at sufficiently high frequencies begins to behave
something like a transmission line with a very low velocity factor.

To investigate what is really happening requires an instrument capable
of measuring impedance versus frequency from HF to VHF. It probably
doesn't exist.

When a coil is used to load a short HF vertical, it operates at a
frequency much lower than its self-resonant frequency and transmission
line effects don't matter two hoots.

Reg, G4FGQ.

There's a difference between memorizing a formula or method and memorizing
specific answers to specific questions. The former is called learning, and
can be applied to many situations. The latter is called laziness, and
teaches nothing that can be used for any other purpose.

Ed, I am assuming you are operating from a fixed location as the
height would exceed that of many bridges on the highway.

Can you get to the roof of the motor home easily enough? If so, I
would mount a bracket on the roof with a quick-disconnect on it. Then
when you reach your location, you can just climb up and mount the
antenna there fro the duration of your visit. Then when mobiling,
move the antenna back to the bumper.

I have operated a lot of mobile 80 and 40 meters. First of all, don't
expect miracles, especially on 80 meters. The placement of either
antenna on the center of the roof of my car has always been noticeably
better than the bumper mount version. I now drive a van and the
antenna is mounted on side of the van. Again, it is much better on
the roof and tunes more easily there too. However, i cannot drive
with it on my roof (I use Hamsticks).

As for your specific question, I don't know the answer, but if you can
find a piece of extension to test it with temporarily, such as a piece
of copper pipe, you might get an answer at an inexpensive cost.

Good luck,
Buck

Mu-metal
From Wikipedia, the free encyclopedia
Jump to: navigation, search

Mu-metal is a nickel-iron alloy (75% nickel, 15% iron, plus copper and molybdenum) that has a very high magnetic permeability. Permeability is represented by ?, the Greek letter mu.

The high permeability makes mu-metal very effective at screening static or low-frequency magnetic fields, which cannot be attenuated by other methods.[1]

Mu metal requires special heat treatment ï¿½ annealing in hydrogen atmosphere, which reportedly increases the magnetic permeability about 40 times. The annealing alters the material's crystal structure, aligning the grains and removing some impurities, especially carbon. Mechanical treatment may disrupt the material's grain alignment, leading to drop of permeability in the affected areas, which can be restored by repeating of the hydrogen annealing step.

Just below its self-resonant frequency, it behaves somewhat
like a transmission line of less than 90 degrees.

> To investigate what is really happening requires an instrument capable
> of measuring impedance versus frequency from HF to VHF. It probably
> doesn't exist.

The low impedance part of the curve (below 650 ohms) can be
had using an MFJ-259B. For my coil, which is self-resonant
at 22.5 MHz, the impedance drops below 650 ohms at 27.8 MHz
and never again goes higher than 650 ohms for increasing
frequency.

The bottom line is that the effectiveness of a coaxial coil
choke falls off rapidly above its self resonant frequency.
For my coil above, 27.8 MHz is only about 25% above the self-
resonant frequency of 22.5 MHz. A coaxial choke works well
at its self-resonant frequency but not much higher.

> When a coil is used to load a short HF vertical, it operates at a
> frequency much lower than its self-resonant frequency and transmission

But maybe one hoot. :-) My 75m bugcatcher coil is operated
relatively close to its measured self-resonant frequency of
6.6 MHz. If I wound a bugcatcher coil to be self-resonant
on 4 MHz and then used 2/3 of that coil for a loading coil
on 4 MHz, its VF would not change and its electrical length
would be 60 degrees accompanied by the appropriate 60 degree
delay through the coil.

That is just hair-splitting. For instance, the first question
in my 2000 Extra Class License Manual is: What exclusive
frequency privileges in the 80-meter band are authorized to
Extra class control operators?

Of the four choices, the correct answer is 3500-3525 kHz.

Now what formula or method will yield the correct answer?
I simply memorized that specific answer to that specific
question. The moral is: "Work smarter, not harder!"

If you are learning theory that someone has already developed,
you *are* memorizing answers. I *memorized* Ohm's law for my
Novice exam. I *memorized* the fact that 'I' is the letter
used for current.

If you are not memorizing answers provided by the people who
developed the theory, then you are necessarily developing the
theory from first principles.

Avoiding memorizing answers to questions is a good way to
keep making the same mistakes over and over. Do you avoid the
Q&A sections of all web pages for fear that you might accidentally
memorize an answer?

Which is exactly what "I" also have said. They're splitting hairs over the definition. MANY words can be used in more than one way. Your example is resembling mine. There are some things (many actually) you must "memorize" (learn) for life - to function. To simply "memorize" answers for a test - as you said, teaches NOTHING. It doens't even guarantee passing. I've seen a few fail by that method. IT simply is NOT a good way to go about things in life. Laziness gets you no where - fast.

So exactly what is the "formula or method" for determining Extra
frequency privileges outside of memorizing them? I was too lazy
to use a formula so I just memorized only what I needed to know
for my Extra exam. I still don't know all the Extra frequencies
for all the bands. Since Extras have all frequency privileges,
I don't really need to know where those frequencies are.

In the example YOU give - Cecil - it could be taken either way. In the case of the "frequencies" you're to operate on for a given license and band - YES - you could simply "memorize" (not really commit to memory) those frequencies - for the exam purposes and just refer to a chart from there in. OR you COULD "memorize" them (actually committing to memory) for the purpose of NOT having to use a chart! However, once you use those frequencies after a while - especially if active - then you "would" tend to "memorize" (for life) those frequencies. Yes, it is definately splitting hairs!

Here's the crux of your communications problem. From Webster's:
"memorize - to commit to memory". *Everything* that one
memorizes is the act of committing something to memory. You
definitely need to pick a different word than "memorize"
to describe the concept you are trying to present. Memorizing
is how human beings remember things and it is a good thing.

Hi Cecil & Reg

Sometime during the '70s I measured the self-resonant frequency of the 80m Hustler loading coil, 6MHz. The series resistance of that coil was 31 ohms at 4 MHz. That is why they claimed 'lower swr than with othe brands'. What a fraud. On the other hand, I also measured the Webster KW-80, self-resonant at 14.0 MHz, with a series resistance of 8 ohms at 4 MHz. I reported this on Page 6-12 in Reflections.

So I ask you, Cecil, why would you want a bugcatcher self-resonant at 4 MHz for operation at 4.0 MHz, even if you used only 2/3 of it as a loading coil. Looking just to heat the coil instead of radiating the energy into space?

Walt, W2DU

Sorry I wasn't explicit, Walt. I use only 2/3 of the coil and
chop the other 1/3 off and discard it. That ensures that the
VF of the coil of 2/3 length is the same as the VF of the
whole coil at the frequency of operation.

The alternate approach would be to extend the windings on a
75m bugcatcher coil until self-resonance was reached at 4 MHz.
The VF could then be calculated and the extra windings
removed.

The purpose of the two above exercises is to determine the
VF of the coil *at the frequency of operation*. The VF of
large real-world loading coils changes with frequency. Knowing
the self-resonant frequency of a 75m bugcatcher coil is
6.6 MHz doesn't (necessarily) yield the correct VF at 4 MHz.

Hello all,

I am new to the group and have a question.

Does anyone know a good source of information on small (less than .1wl), shielded (coax) magnetic loops? In particular, I would like to know design equations (are ON4UN's formulae correct and complete?). Why do most people use RG-59 rather than a thicker coax (shielding, C/ft?)? Why is 20' for 160 meters the norm? Discarding mechanical considerations, wouldn't thicker coax provide greater efficiency?

I found ON4UN's book lacking on this antenna.

Thanks in advance,
John, N9RF

That behavior is perfectly normal. Length above the coil has far more
effect than length below the coil. Mobile operators have observed that
effect forever. Perhaps someone else can explain the physics involved?

Eh, excuse me, it was not "I" who started splitting hairs here with regard to MEMORY AND MEMORIZATION.
"I" KNOW what "memorization" means - I was using it in the "SLANG" sense that YOU all are arguing about - memorizing something for just a few moments of need as opposed to a "lifetime". There ARE "SLANG" uses for popular words which do NOT coincide necessarily with Webster. Again, it was not "I" who started this ridiculous argument.

AND for what it is worth - if you're (whoever this applies to) that freaking lazy to not want to have to "learn" something - then it is no damned wonder this country is going to hell. The downfall of our Education system begins with that very principle (refusal to learn). I don't give a crap WHAT Hitler or some other idiot said about being lazy and smart - if you're lazy - you are no damned good to society or yourself for that matter. The REST of us who have to pick up the pace to deal with the slackers. I'll be damned if I ever hire a "LAZY" smart person. I want a person who is going to EARN their keep. Sitting there telling me how things should be isn't what I would hire them for - the purpose is to DO the things as they're supposed to be done.

Working smarter - not harder - is a good concept - but I DO NOT THINK - the originator of it meant for LAZY asses to be using it as an EXCUSE to not have to learn. I live by that concept (work smarter - not harder) often but it sure in hell hasn't stopped me from having to - OR DESIRING to LEARN.

Lou

A loading coil on an electrical 1/4WL mobile antenna can be
conceptually understood as an electrical 1/4WL stub. Consider
the following two electrical 1/4WL stubs.

Source-----Z01------+-------Z02----------open (example 1)

Source----Z02----+----Z01----+----Z02----open (example 2)

Assume Z01 = 4000 ohms, VF1 = 0.02; Z02 = 600 ohms, VF2 = 1.0

Although somewhat counterintuitive, the length of the piece
of Z01 line in the second example needs to be longer than
the piece of Z01 line in the first example to achieve an
electrical 1/4WL stub. Laying it out on a Smith Chart will
uncover the reasons.

In fact, if we create an electrical 1/4WL stub like this:

Source-----Z02-----+-----Z01-----open (example 3)

the sum of the electrical lengths of the two sections will be
electrically *longer than 1/4WL*. This is equivalent to putting
the loading coil at the very top of a mobile antenna with no
stinger.

Degrees of antenna are gained at a Z01-->Z02 discontinuity,
i.e. at the loading coil to stinger transition point in
example 1 above.

Degrees of antenna are lost at a Z02-->Z01 discontinuity,
i.e. at the base element to loading coil transition point
in example 2 above.

But Cecil, I thought this thread was about chokes to prevent common-mode
currents from flowing on the feed line.

Now yer talking about loading coils for mobile whip antennas. As I understand
the issue, one is 180ï¿½ from the other. For the choke you want a high resistance,
which is what you get at the self-resonant frequency. But for the loading coil
you want the lowest series resistance possible, which you don't get when
anywhere near the self-resonant frequency.

Like I said above, the Hustler 80m loading coil achieved 'low swr' by making the
coil self resonant slightly above 4 MHz, with a series resistance of 31 ohms.
Now you are suggesting a bugcatcher coil self-resonant at 6.6 MHz, which means
yer coil is going to give you a nice low swr, but yer losing half of yer power
in the coil because of the high series resistance you can't avoid. Yer also
losing yer mind.

Walt

Sorry, my unabridged dictionary doesn't acknowledge a slang
definition for "memorize" as it certainly does for other
words used as slang. You really need to find another word
to use to define your concept. You seem to be talking about
temporary storage, the exact opposite of memorizing.

Yes, carrying the subject over from an earlier thread on loading
coils. There is a master's thesis paper authored by the Corum
brothers, K1AON and KB1EUD, and sponsored by the IEEE at:

http://www.ttr.com/TELSIKS2001-MASTER-1.pdf

which deals with RF coils. Although aimed at Tesla coils, it
contains lots of useful information for hams. In particular,
it predicts the VF for large real-world coils which is very
useful for me. It essentially shoots down the argument that
the current through a real-world loading coil is the same
at both ends of the coil, i.e. the delay through the coil
approaches zero as presented by the lumped circuit model.

> As I understand
> the issue, one is 180ï¿½ from the other. For the choke you want a high resistance,

My point is that the same laws of physics apply to loading coils
and coaxial coil chokes even if the applications are different.
And we do, quite often, operate our 75m loading coils fairly
near their self-resonant frequencies - like your Hustler example.

Well, that is the measured self-resonant frequency of my often
glorified 75m Texas Bugcatcher coil supposed to be one of the
highest-Q coils available.

Yeah, but Cecil, have you ever actually MEASURED the series resistance? The slope of the resonance curve that peaks at 6.6MHz ain't gonna be low enough at 4.0. MHz to make an efficient mobile antenna. The Hustler coils, with 31 ohms series resistance was a hoax on the average ham who didn't know the real reason the Hustler gave them a low swr, which is what they mistakenly thought was paradise. When it comes to efficiency in an antenna with a loading coil, the best efficiency comes with the highest swr in absence of any attempt to match the terminal impedance to 50 ohms.

IMO, Cecil, you've been hoaxed if you thought a coil self-resonant at 6.6 MHz was a high-Q coil at 4 MHz.

Walt

Now you're trying to be a smart "ass" (there's some slang for ya) :) .
Again, it was not "MY" argument here - splitting hairs. AND as for thinking,
I think you ought to go back a couple days or better and reread the threads.
Unlike some in this ridiculous argument, I DO think.. I THINK IT IS CRAZY.
Don't you all have something better to do? I don't care what "YOUR"
dictionary shows. There are some out there for example which show the word
COCK for example - as a type of Bird OR the preparing of a rifle or gun for
firing and leave it at that - while a "few" others will show the "Slang"
term used - as many do - meaning sexual organ. SO - ALL DICTIONARYS ARE NOT
CREATED EQUAL. What may not show up in YOUR dictionary as slang - may
certainly - in others. AND perhaps it was a "misuse" of the word
"Memorize" - I was merely trying to rationalize where you AND AL Klein both
were coming from. Now, neither one of you make any sense - he argues against
memory and you against having to do any work. MANY people "misuse" words -
very much and very badly. MY (mis)use was ONLY intended for the sake of this
STUPID argument.

>Ham radio is gonna be flushed big time if this is all you old farts are
>worried about.

Steve, you may be quite right!

There is NO expression from these federally-authorized morsemen
of amateur radio being a HOBBY. [it is a "service" to the
country or something para-military...and "hobby" is not in the
Rules (except by definition)] Indeed, they bristle and come
unglued at the slightest negativism of their mighty endeavors of
"professional amateurism" with all its rank, status, and glory.
Ham radio can't be just "fun" for its own sake, an enjoyable
pastime, something done for personal pleasure. No, one has to
enjoy ONLY Their views, like what they like, or suffer the
consequences of being considered "lower caste" on par with
river-bottom slime.

These mighty macho morsemen demand OBEDIANCE to their views and
opinions, are quick to call disbelievers any name they choose,
always denigrative, condescending, with heavy overtones of
attempted humiliation. They are the unforgiving in regards to
anyone NOT worshiping their status, rank, titles in amateurism.
Unforgiving to the point of attacking ANYONE against them.
They RULE. [they think...but only in here...]

While these mighty macho morsemen take out their frustrations,
resentments, anger against all not idolizing their opinions,
there are some actual amateur radio issues which need addressing.
The removal or continuation of the morse code test for US amateur
radio license testing is still in limbo; official Comment period
on the NPRM was over late last year. Access BPL recently had a
rules revision/addendum added by the FCC with a Report and Order
released on 7 August 2006. No one in here apparently cares about
it since the "ARRL is on the job," "fighting" to keep HF "safe"
(for their membership?). [ho, ho, some "fight"...]

No one cares to discuss two BIG issues. Everyone is busy, busy,
trying to insult anyone who doesn't subscribe to Their views.
Ain't no "discussion" here, hasn't been for years. Internecine

personal warfare is the order of the day. Everyone in here either obeys the rulings of Big Brother in Newington or they are considered lower forms of (barely) life.

The number of US amateur radio licensees is slowly dropping (expirations greater than new licensees to the tune of 10K in three years). Membership in the ARRL (the "representative" of all, according to them) has never been more than a quarter of all US licensees. Technician class licensees are very very close to being a full half of all classes (49.07% of all individual licensees as of 12 Aug 06).

Lettuce all bow our heads and worship morsemanship...these are the salad days of the brass-pounders. Morse is the answer to everything I'm told. [over and over again] :-)

Beep, beep...

For a short time, you had my attention as being correct at least part of the time - in this ongoing dumb argument. But here's where we part ways - "along with the "memory" deal - which "I" didn't start.

A "brilliant" "lazy" person - isn't worth a dime. Brilliant ? BY WHO's DEFINITION? I have a ton of books in my reach too - so whats your point? Yes, SOME are "reference" books - but many I spent hours in "STUDYING". It is the "reference" books I use for things not used daily or even at times month to month. Books on hobbies I have but not enough time to get into as much - or repair manuals for my test equipment - should I need to do so. Having a ton of books at arms length doesn't substitute for KNOWLEDGE OR WORK. Those "books" sure in hell aren't going to "troubleshoot" equipment for me to earn my pay. They're not going to diagnose my body to heal me. They're not going to fix my vehicle "just" by having them at arms length. They may make you LOOK smart! They won't "make" you a Ham operator, Nuclear Physicist, Doctor, Lawyer, Mechanic, etc.
SO what - you can pull (legal/physics/etc) laws out or Meds and dosages, spark plug clearances and so on - BIG DEAL. anyone with half a brain can do that. Even those who busted their ass to get to the top have to keep "working" at it to STAY at the top. Even today, Bill Gates - smart as he is, I'm sure is still working on "something". I'm sure he doesn't sit there with his ton of "reference" books at arms length - and do NOTHING. And I'm DAMNED sure - he had to study long and hard to learn all he knows to get to where he is today. I will bet my last dime he would tell you himself - it wasn't easy. It took LOTS of hard work, dedication, studying, committment, TRIAL AND ERROR - to make things work. TRIAL AND ERROR doesn't get done sitting on your ass. NOTHING worth while - does. UNLESS of course that so called "brilliant" "lazy" person is collecting a welfare check - smart yes - but not enough to be gainfully employed. Ya know - I have knowledge of a man who can recite transistor theory and much much more - formulas and all from

his head. BUT - the poor bastard can't even solder. He has NO clue on how to troubleshoot or repair. So, tell me - what good is it to JUST be "brilliant"? AND AGAIN - BY WHO'S STANDARDS? Hell, I've known supposedly slow and/or "mentally retarded" people that put so called "knowledgeable" people to shame. They talked with more sense, didn't assume they knew everything and sure in hell weren't afraid to TRY to work. Those who "CLAIM" to know everything - usually aren't worth a plugged nickle. We ALL have something to "learn" each and every day of our lives. Anyone who thinks otherwise or that they know it all - are DEAD already. They won't get anywhere in life. "I" for one will NEVER EVER claim I know "everything". I LOVE to learn new things and look forward to each new adventure - be it repairing something - tackling a new problem never seen before to learning things to do with my "other" activities that take up many hours of my life. In THOSE fields - "knowing it all" can get you KILLED.

Sorry dude - I jumped track from agreeing with you..... Pick it apart all you want. LAZY DOES NOT WORK - no matter which way you cut it. I'm leaning in the direction that you've apparently bought one of those GET RICH QUICK WITHOUT WORKING books..... SORRY DUDE - THEY DON"T WORK.

L.

And as for "Hitler" claiming that - as you said about his admiration for a brilliant lazy man - eh..... last I heard - the man was a fruit cake, lost the war, cost thousands of lives, innocent ones at that - and ended up committing suicide - WHAT A LOSER. And I would want to follow his examples/principles - why?

You can find quite a bit of discussion about small loops if you search the archives of this group. That, however, may confuse you because some folk seem intent on making absolute statements about things they don't really understand. Reputable books will tell you that the "shield" is actually the antenna, and to gain the advantage of rejection of local predominantly e-field noise, you must make the loop very symmetrical. I know that Jasick's Antenna Engineering book has a good chapter on loops, and King, Mimno and Wing's "Transmission Lines, Antennas and Waveguides" has a good qualitative discussion of them. There are various programs out there to help you determine the performance of small receiving loops. I've found one on Reg Edwards' web page to be useful.

Cheers,
Tom

Those weren't the answers, they were the facts that allowed you to
figure out the answers.

>If you are not memorizing answers provided by the people who
>developed the theory, then you are necessarily developing the
>theory from first principles.

The people who developed the theory in the 19th century didn't
"develop" the answers to tests created in the 20th century.

>Avoiding memorizing answers to questions is a good way to
>keep making the same mistakes over and over.

Then you must be an expert in avoidance, since you keep making the
same mistake post after post. Memorizing theory is NOT the same as
memorizing test answers. If information and test answers were the
same, owning a book with the information needed to answer the
questions on any test given in any public school would probably be
illegal in all 50 states.

The same hair splitting as the difference between stealing money and
earning it - they're both methods of obtaining it.

But, since you don't know the difference between "learning" and
"memorizing", nor which subjects fall into which category, you
probably can't see the parallel.

There's no *need* for you to even know that you can use a radio to
talk to people.

There's a need, if we want a ham license to say that the holder of
said license has achieved a certain level of technical competence, to
test for that competence. Otherwise all the license says is "I have
this piece of paper with ink on it".

that is a chnge in tune

oncce you accpet that much of the testing involves memizztion the
question then comes down to where is your beef?
if it is that today we then to use multiguess questions pools verus
short answer of bygone day you likely out of luck the extra cost is not
going to be supported within the present system

I agree short answer would be an improvement over multible guess but
teks you issue up with other don't imply that the ams that have taken
and passed the required tetst have not done what is required

you tread awfully close to libel there AL ask an lawyer if you don't
believe me

> was a high-Q coil at 4 MHz.

All I know is that Texas Bugcatcher coils tend to be
near the top of the the 75m mobile shootout results.
Using base loading on a GMC pickup, it is resonant on
3.8 MHz with a six foot stinger. Remove the stinger and
it is self-resonant at 6.6 MHz.

My 75m Texas Bugcatcher coil was a gift from K7JEB.
It is 26.5 turns at 4 tpi on a 6" air core form.
Calculates out to be about 70 uH. I don't know how
to make it higher Q.

From my dictionary: "cock - 5. Slang (vulgar) a. penis. b. sexual
relations with a man."

Seems my 2230 page unabridged dictionary covers slang very well but
does not have a slang definition for "memorize". Please try again.

Learning is impossible without memorizing. You are
simply ignorant of the definition of the words you
are using. Is English your second language? Again,
from Websters: "memorize - to commit to memory"

I don't care what your dictionary says. PEOPLE MISUSE words ALL the time -
and definately in this case. "I" again STATE - "I" DID NOT START the "hair
splitting" argument. I was merely trying to rationalize where BOTH of you
were coming from and sadly neither of you know yourselves. AGAIN I SAY -
THIS WHOLE FREAKING ARGUMENT IS - STUPID.

L.

Which is more practical?
Driven element with two directors or reflector, driven element,
director.

OK, so maybe I misrepresented your quote "by accident" - big deal. HITLER was still a loser as was/is ANY ONE who bought/buys into that STUPID philosophy you spoke of. Pretty damned sad when you - speaking of ANYONE it applies to - are too "lazy" to "learn". That is almost laughable. Creative thinking - without knowledge? Surely you jest!

I'm done arguing with someone who is "too" lazy to "learn". I'd prefer to talk to those who have "intelligence" to refer to - to stimulate the conversation. Good luck in your monologue.

This was a WWI German officer and I don't recall his name.
Why do you think he was an idiotic strategist? Why do you
think he single-handedly lost WWI? If you know so much about
him, what was his name?

> Being both intelligent and ambitious doesn't appear on your radar?

The pride, lust, and greed usually accompanying ambition are
a good percentage of the seven deadly sins.

2113. Moving again... have to make a new antenna (sigh)

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-13 00:30:52 UTC
From: eternalsquire@comcast.net
Message-ID: <1155429052.626794.225160@h48g2000cwc.googlegroups.com>
Source record: 54700

All,

My family is having to move again.... The place I am moving to is on
the edge
of a circular trailer part, surrounded by a metal fence about 1 mile in
circumference.

On the other side of the fence is an effectively infinite backlot
studded with
6 to 9 foot mesquite trees.

This time I am not allowed to get the antenna up any higher than the
fence or
the mesquite trees. However, length is a definite possibility?

Any suggestions for making the most of this situation for low-angle DX
on 40 or 20?

Thanks in advance,

The Eternal Squire

>
> Lou

Let me rephrase my original statement. Learning something means you can actually use what you learn. It is more than the ability to parrot what you have memorized. You can memorize the answers from the back of the Teacher's Edition of a textbook, but you are not LEARNING anything. This is exactly what you are doing when you memorize the answers to a pool of questions. You don't KNOW anything. If you LEARN the material, you can take any given set of parameters and formulate an answer to anything you need to know, WITHOUT having to go to the shelf to look it up in a book (which, BTW, you can't do when you're needing complex mathematical equation to figure out the frequency of resonance for a capacitance of 120pF and an inductance of 3uH (or the x of c or x of l for such a circuit).

Of course, none of this means anything to an appliance operator.

Appliance operator: n. c. 1985 An amateur radio operator who knows only enough to tune the VFO on his radio and speak into the microphone. Some advanced appliance operators know enough to connect other peripheral devices such as digital mode devices or power amplifiers, but do not know how these devices work, nor how to construct such devices.

An amateur radio license is an entry level license. It is
not a university degree. When I obtained all amateur privileges
at the age of 15, I didn't know squat. All I had done is memorize
the ARRL License Manual. Six years later I had a EE degree. What
is wrong with learning the technical stuff after one obtains his
entry level license?

Do you know how to construct an IC-756PROII?

A MENSA membership means you have a high intelligence quotient. A high
intelligence quotient does not necessarily mean you know anything, only that
if you apply yourself that you have the ability to learn more easily than an
average person. I know some very lazy MENSA members that can't even spell a
large number of the words they use.

In other words, even people above average intelligence can be and often are
too lazy to learn. They do manage to apply what they do know better than
most.

For a long time, they were.

The coding system was similar to that for resistors, but there were
additional stripes or dots to denote voltage rating.

I'm guessing #12 wire in the coil, which leaves lots of spacing between turns , which should make the distributed capacitance very small. I haven't made any calculations, but a seat of the pants estimate would say the self-resonant frequency would be much, much higher than 6.6 MHz. (As I remember, the Hustler used #14 close spaced on about 2" diameter to obtain a self-resonant frequency at 6MHz.)

Cecil, I suggest you re-measure the self-resonant frequency of the coil by itself, and if you have the means to do it, also measure the series resistance at both the self-resonant frequency and at 4.0 MHz. I'm betting there will be a large difference in the resistances, and that the self-resonant frequency will be much greater than 6.6 MHz.

Walt

Here here (!)
Cecil, I'm happy to agree with you.

Modern testing techniques are intended to be transparent. This is true
for FCC exams, Postal exams, any and all government qualification exams.
(And because of this, all qualifying exams in the private sector, as
well.)

It took a lot of litigation to get there. Government agencies had to
prove that their qualifying exams were directly linked to the specific
tasks required of the given position for which the individual was applying.

A Postal Carrier needn't know Pythagorus' theorum to deliver the mail.
I took the Postal Carrier exam 35 years ago and did not do well. I
wasn't good at sorting on a timed basis.

This notion of a "cheapening" of FCC requirements because the question pool is open to the public is a red herring: transparency is the rule. If you look at the question pool and study it, you will gain the necessary expertise to pass the exam. This is not cheating, nor is it short-circuiting the "REAL" ham radio "requirements" that some view as sacrosanct.

I used ARRL manuals to pass the Extra Exam and I do not defer to anyone in this regard. Does this make me a ham radio genius? Not AT ALL. Man, I have SO MUCH to learn. This newsgroup is "potentially" very helpful! For that, I give thanks.

You know, I love ham radio. I'm happy so many join the ranks each year. If there still is a concern out there, be an Elmer and address it.

To me, MENSA is a sort of "Who's Who". As such, one can value it
appropriately or ignore it completely. To me, it's a sort of conundrum:
If you are confident in your intelligence, why do you need validation?
Is it the obverse of the T-shirt "I'm with stupid"?

My apologies for adding to this old and fraying thread.

John

Mensa - who gives a damned? Most of the "brilliant" people I've ever met -
had their thumbs up their ass when it came to doing the basic things in
life - they can't do them. What the hell good is a "brilliant" person if
they're too stupid to know how or lazy to do "basic" things? If having a
Mensa number means you're bankrupt in common sense or "lazy", I'd rather not
be a member - thank you. Often, it is "common sense" which gets you
through - NOT "brilliance". From all I've ever heard and /or seen -
"brilliance" and "common sense" don't go hand in hand. Sitting in a chair
with a bunch of books behind you to make you "appear" smart and not getting
off your lazy ass to use it or to further your education - is not a
"productive" person. I know a few welfare bums who fall into that
description- "appear" smart, "act" smart - lazy as hell. Being in the center
of a University Library with books on most any subject - is NOT going to

make you any more intelligent if you don't venture to "learn". Even at that, if you don't use it, you lose it.

This is funny as all hell..... some shmuck "claiming" to be a "genious" coming in here and trying to make the rest of us seem inferior to him. No one is any better than the rest of us. Their crap doesn't stink any less than ours. Just when he starts losing his grip on the argument, he pulls this so called mensa number out - just like a race card. So, what, we're supposed to take pity? Bow down? I don't think so! The answer to that is "PLONK".
There was another party a few years ago tried that - and after about a month - him and his self proclaimed "geniousness" - disappeared. The idea here is to come in - share ideas, thoughts, "help" if possible - NOT try to place yourself on a throne above all. I can assure you the majority of us don't tolerate that attitude. You can agree or agree to disagree on any use of words, theories, laws, principles, strategies, etc. But when you put yourself on a pedestal..... the game is over - you'll either find one of your mensa friends to keep you company or be an awful lonely person on here.

To respond to a statement regarding me in a previous post - Hams like "me" NEVER kept or attempted to keep any one off the air. If anything, I've gotten people "involved" in Amateur Radio - with one (12 years old at the time) going on to higher education once out of high school - and getting a very good job from it. His parents couldn't thank me enough. Even if that is the only good example of the good I am/was able to do - in Amateur Radio, then I'm satisfied. But I haven't stopped there..... I teach Amateur Radio classes when asked - and on other occasions - I've taught basic electronics - taking those folks beyond the Study Guide.
It is nice to be able to "use" and "impart" that knowledge so that others can benefit.

I don't know if there is actually any truth to this BUT - the dumbing down "allegedly" started back in Reagan's day or was it George Srs? - when someone here in the U.S. apparently couldn't pass the exam - and being he was in good relations with the then King of Jordan, the King of Jordan asked Reagan or Bush Sr to do something to help out. I've heard that story a few times. True or not - the tests have changed drastically.

The tests really (in my opinion) aren't meant to "teach" anything or shall we say - show any "in depth proficiency". The study guides give you "just" enough to pass the exam - without going into a lot of information. You certainly can't pass a novice OR extra exam and instantly qualify yourself as an Electronics Technician. The material just isn't that in depth. For that matter, the GROL tests and accompanying manuals don't do a hell of a lot either for "teaching" - or showing "proficiency". They're merely meant to get you in the door - period. The latter is scary - considering that the GROL though diminished in need in most cases as of this point in time - IS still required in "some" cases - as a sign of "knowledge" of the subject. That is why many places that I know of, produce their own exams - designed to actually test your knowledge. One guy I know - been in 2 way radio for years, good at it, smart as a whip - took an entry exam to get a new job. Said that was the most in depth - "drilling" - organized test he ever took, considering he had his Commercial license "pre- GROL" and his amateur license.

I have read articles from a leading publication in the industry that there is a move afoot to get the FCC Commercial License - some teeth put back in. Why? - Due to an increasing issue with interference and so on. Seems to me, though in some cases - the horses are already out of the barn and "maybe" too late to try to close the doors, changes "could" be made. What gets me,

is that article spoke of another agency doing the testing and licensing. So - in other words - the FCC - our "RADIO" governing agency has lost its grip on this? IF the FCC can't control it, how the hell is some "private" agency? Not that it would happen, but I have to wonder just "how" they may want to try to differentiate between those with GROLs and any subsequent endorsements - of those who just read a "study guide" enough to pass - from those who have "actual" electronics schooling?

As an examiner for FCC Commercial AND Amateur exams, I've seen many folks come through. You can usually pick out those who know their stuff and those who do not. You can also usually pick out those who DO know the stuff but freeze on exams. For what it is worth - at least in my experience here, most who have "schooling" do NOT usually bring any type of "study guide". I've tested whole groups of School students and not one study guide was to be seen. Same goes for those who are "comfortable" with their knowledge of Ham radio. They simply feel - if they don't know it by test time - then no sense testing. For the GROL, it is an expensive proposition if you don't know your stuff or haven't been able to grasp the study guide material. Back in the day - it was usually the cost of a LONG trip (maybe lodging too) to an FCC office, now they're more local but cost is still there - pass or fail. Come to think of it, if the current rate increases stay the same - soon - the Amateur Exams will cost almost if not as much as the GROL! They're almost half way there now - depending on which VEC/TCM you go through.

Yes, it is going to be very interesting indeed to see how things progress not only in the Amateur Licensing area, but also the "Commercial" side as well - for the next few years at least.

Eh, not really..... I'm "agreeing" with you as to his content. As to mine, I was basically replying to what Brenda Ann had said. He didn't hit a "soft spot". People like that - I just find very ignorant. You're right, it is funny! My exchange with him died with my last contact with him. I'm merely replying to others. AND giving my opinion about people like that. Him get to me? THAT IS FUNNY! I've had better people try. So, in that regard I'll disagree with you. He didn't budge my blood pressure - one iota. So, sorry - he gets no stars. I've just agreed to disagree with him and am agreeing with the others - YOU included (to the point mentioned).

This is funny as all getout <angry diatribe snipped>

Obviously the person claiming to be a Mensa member has poked a figurative
finger into your soft spot. Sensitive, are you? Taking umbrage? Apparently
you feel that the alleged Mensa member has slighted you either directly or
indirectly, ergo your lengthy and uncalled-for diatribe.
Of course, in your self-righteous response you probably did not consider the
possibility that the "Mensa" person was a troll. Makes no difference, does
it? He certainly set you off on a rant.
I give him five stars for that.
```

Sit back, read the post again and view it with a bit of a tongue-in-cheek sense of humor. It will lower your blood pressure. Even if the guy IS a Mensa member, by the simple fact of him bragging about same shows that he is a blowgut braggart whose ego has gotten in the way of common sense.
I doubt he is what he says he is, but he certainly elicited a wordy response from you.
He wins. You lost.

2130. how many forum members to change a lightbulb?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-13 08:42:47 UTC
From: Fred Hambrecht <w4jle@w4jle.com>
Message-ID: <3e81c$44dee622$471d24de$25131@ALLTEL.NET>
Source record: 54717

How many forum members does it take to change a lightbulb?

1 to change the light bulb and 1 to post that the light bulb has been changed

14 to share similar experiences of changing light bulbs and how the light bulb could have been changed differently

7 to caution about the dangers of changing light bulbs

27 to point out spelling/grammar errors in posts about changing light bulbs

53 to flame the spell checkers

41 to correct spelling/grammar flames

6 to argue over whether it's "lightbulb" or "light bulb"

... another 6 to condemn those 6 as anal-retentive

2 industry professionals to inform the group that the proper term is "lamp"

15 know-it-alls who claim they were in the industry, and that "light bulb" is perfectly correct

156 to email the participant's ISPs complaining that they are in violation of their "acceptable use policy"

109 to post that this forum is not about light bulbs and to please take this discussion to a lightbulb forum

203 to demand that cross posting to hardware forum, off-topic forum, and lightbulb forum about changing light bulbs be stopped

111 to defend the posting to this forum saying that we all use light bulbs and therefore the posts are relevant to this forum

306 to debate which method of changing light bulbs is superior, where to buy the best light bulbs, what brand of light bulbs work best for this technique and what brands are faulty

27 to post URL's where one can see examples of different light bulbs

14 to post that the URL's were posted incorrectly and then post the corrected URL's

3 to post about links they found from the URL's that are relevant to this group which makes light bulbs relevant to this group

33 to link all posts to date, quote them in their entirety including all headers and signatures, and add "Me too"

12 to post to the group that they will no longer post because they cannot handle the light bulb controversy

19 to quote the "Me too's" to say "Me three"

4 to suggest that posters request the light bulb FAQ

44 to ask what is a "FAQ"

4 to say "didn't we go through this already a short time ago?"

143 to say "do a Google search on light bulbs before posting questions about light bulbs"

1 new forum member to respond to the original post 6 months from now and start it all over again

The self-capacitance of a multi-turn solenoid has little to do with
spacing between turns. Self-c depends on coil length and diameter.

The self-capacitances between adjacent turns are all in series with
each other. Resulting capacitance across coil is negligible.

A coil 6.6" long, 6" diameter, 26.5 turns, has L = 68 uH, Q = 500 at
3.8 MHz, and self-resonant frequency = 9 MHz.

IMHO, it depends on what you want the Reflector modifies the dipole
pattern to a given direction. A dipole-director favors a direction but
still has more gain on the side with the director.

I'm not sure how to measure the 1/4WL self-resonant frequency
with an MFJ-259B without a ground plane. I suppose it could be
done using a 1/4WL counterpoise in free space. Let me just
report what the MFJ-259B readings are with the isolated 75m
Texas Bugcatcher coil across the MFJ-259B terminals.

The first dip in impedance is at 14.7 MHz where the MFJ reads
620+j0 ohms. The second dip in impedance is at 24.4 MHz where
the MFJ reads 88+j0 ohms. Is the first dip the 1/4WL self-
resonant point and the second dip the 1/2WL self-resonant point?

I want to make it clear that the previously reported 6.6 MHz
self-resonant measurement was made with the base-loaded coil
mounted a few inches away from my GMC pickup ground plane. The
ground plane was no doubt in the field of the coil at the bottom
end so the coil was certainly not isolated as it is in the above
reported measurements.

> If you are confident in your intelligence, why do you need validation?

In my case, my wife's best friend's husband, who was a member
of MENSA, made a bet with me that I couldn't qualify for MENSA.
If I won, he would pay for the exam and my first year's dues.
If I lost, I was out the cost of the exam and dinner for 4.

Neither one is worth building at 2 meters. A 5 element beam with a
reflector, driven element. and 3 directors could be built on a 4 - 5 foot
boom.

Exactly as you are trying to use your Morse code skill to make nocode
techs feel inferior to you "real hams". (Incidentally, what good is
Morse code skill when one can't even spell "genius"?)

> No one is any better than the rest of us.

Strange words from a man who has been pounding his chest because knowing
Morse code makes him so superior.

If I remember correctly, the incident had nothing to do with
dumbing down technical issues. It was all about the outdated
Morse code testing requirement which a lot of countries have
indeed dropped.

> The tests really (in my opinion) aren't meant to "teach" anything or shall

Of course not. They are entrance exams, not university degrees.

Exactly! That is their entire purpose. They open the door to
a lifetime of learning.

My reporting my MENSA membership is usually a troll aimed
at someone who feels himself to be superior to everyone else
for some obscure reason, e.g. Morse code skill. Note that
not only is a lack of Morse code skill belittled but MENSA
membership is also belittled. In fact, any difference from
the attitudes and attrubutes of the poster will be belittled.
Even correct definitions of words have been belittled.

Truth is, I got into MENSA because someone lost a bet and
paid for my exam and dues. I am not presently a member of
MENSA because the yearly dues exceed my threshold of pain.
But I am a member of OOTC and FISTS, #8741. :-)

I don't view testing in this regard as a form of teaching. The goal, as someone posted, is to "get in the door". What's wrong with that?

Memorizing precise answers and not processes is lazy, I guess. However, following ARRL testing manuals, you HAVE to learn the processes.

Deep understanding of all principles involved will gain you an educational degree. That's not the intent of FCC testing.

It's a hobby! Get in the door and have fun.

==========
Cec,

Very likely. But not very much.

It would not be the self-resonant frequency any more. The srf never
changes. And neither does the intrinsic coil Q.

We must be careful with our descriptions. Slackness leads to
misunderstandings, arguments and fights.

The Balanis have an extended chapter on loops, but nothing on shielded
loop. But it is a very interesting reading in all cases, as well as
other books too.

I think at it is because RG-59 is cheaper. The parasitic capacitance
don't have a big impact on a small loop because you will have to use an
additional capacitor to get the antenna to resonate on the frequency you
want to receive.

Cheers,
Dominique

Shielded loops are needed only when a small loop is used for
direction-finding purposes. It is then an angle-measuring instrument.

Shields serve no useful purpose on ordinary receiving and transmitting
loops. They reduce efficiency. All that is needed is a bare loop
conductor.

For multi-turn receiving loops download program RJELOOP3

For transmitting magloops download program MAGLOOP4 from website
below. Download in a few seconds and run immediately.

I am sorry, but do you type with your feet?

Anyway,,
Back in the old days, we used to walk 5 miles in the snow to the FCC
field office to take our exams. We had to kneel on radiators while we
took the test. We used slide rules and crayons AND WE LIKED IT!!!

Then we'd wait 3 years to receive our license which gave us time to
teach electrons to enter and exit all the tubes...stupid little buggers,
those.

Boy, those were the days. When a ham was a ham, brass was for pounding
and AM signals were as wide as the day is long.

These "young" whippersnappers get off too easy.

I say, rank priveleges on the basis of how big an RF burn you can take,
or on the basis of personal weight.

I may have said it before: take the FCC out of it completely and go with the FDA. Those boys know how to grade.

(Too much tea this morning!)

Cecil --- you are begging the question!!

I reported that the addition of 3 or 4 inches above the coil produces a much larger shift in frequency than adding the exact same length below the coil [by almost a factor of 100:1]. That is empirical data. It is real and measurable.

My question is one of Physics. I think everyone who reads this list knows it happens. The real question is: Why?? Why the difference in antenna resonant frequency?

FS: DX ENGINEERING BALUN
MODEL DXW-BAL600-H10-A
12:1 high power, rated for 5 kw continuous, 10 kw intermittent, easily
handles full-limit AM or SSB. 1.8-30 Mhz, suitable for wide spaced 600
ohm open wire feeders.
Like new, used approx. 6 months, installed indoors, has never been out
in the elements.
See
http://www.dxengineering.com/Parts.asp?ID=97&PLID=50&SecID=10&DeptID=33&PartNo=DXE%2DBAL600%2DH10%2DA
for detailed specs and photo.
$125 includes shipping anywhere in continental USA.

In a receiving antenna, efficiency is not as important as in a
transmitting antenna, especially on 160 and 80m where the noise floor is
usually far louder than the receiver's front end. A little antenna
attenuation may actually HELP with intermod distortion and other receiver
problems.

I've made working loops for both bands from LMR400 that can actually be
hung out and used for transmitting. They are about 4 feet in diameter
and performance is so-so, but they work. I used the internal capacitance
of the coax to resonate them (a lot of cut and test with the analyzer)
and matched them with a large gimmick capacitor of flat phone wire wound
onto the loop near the feedpoint.

Look up Ted Hart's small loop design. Mine are similar, only I did two
turns for the 160 loop (it's actually physically smaller than the 80m
loop by a bit).

Dave,

Any antenna is a large network of distributed impedances. You have series inductance in every conductor and capacitance to the outside world. There is also some series resistance and even shunting losses in dielectrics, but looking at the reactances is good enough to answer your question.

Look at what we have in the short mobile antenna. Below the loading coil we have a conductor that carries an almost uniform current, voltage and current are nearly in phase throughout the entire length. We have the loading coil that adds a high value of series reactance all in one spot. Above the loading coil we have an area with very high power factor. The current and voltage are nearly 90 degrees out of phase and voltage is very high.

When we perturb the system below the coil, it isn't terribly sensitive to changes in capacitance because voltage is so low. The top of the mast below the coil is terminated in a fairly low impedance so it isn't sensitive to shunt capacitance and the additional series inductance added by the small additional length is very small compared to the system's overall reactance and electrical length at that point.

Above the coil it is another story.

Now we have very high voltage (it can still have almost the same current above as below the coil if the antenna is a good design). The coil is terminated in a very high value of reactance that is mostly comprised of the distributed reactance of the small whip, and that is mostly capacitive reactance of a very high impedance.

Altering the whip length or diameter above the coil greatly changes the system resonance because the small value (very high reactance) of the whip is what actually resonates or terminates the coil.

The loading coil and the capacitance above the coil form a series resonant circuit. The area above the coil has very high impedance, very high power factor, and as such is very sensitive to any additional

shunting impedance caused by additional length or diameter.

The area below the loading coil has almost unity power factor, has low impedance, and has much lower levels of electric field so it isn't nearly as sensitve to shunt impedance (distributed capacitance) changes.

Let me try. If you look at the antenna as a set of lumped circuit bits,
the lower mast portion is mostly just a wire with radiation losses. The
coil and stinger form a series resonant circuit back to ground, thus a
small change in either will result in a different resonant frequency.
The antenna only presents a low, resistive load, at resonance, so
changing the stinger length (thus varying the capacitance to ground)
changes the resonance rapidly. Changing the length of the high-current
lossy feeder pipe below the coil does little, though it will increase
efficiency if you make it as tall as possible.

Reg, I had never given much thought to the series relationship of the
capacitance between turns. I had always considered them as being in parallel,
thus the honeycomb, or the basket-weave configurations to minimize the interturn
capacitance. Have I misconstrued the purpose of those configurations?

Do I also understand you correctly that with a specified length of the solenoid,
and a given diameter, the total interturn capacitance is independent of the
number of turns, because the capacitance between turns adds in series to the
same value regardless of the number of turns?

Please educate me.

Walt

Of course I am, nobody knows *why* things are the way they
are. There is no 'why' built into quantum mechanics. There
is only probability. Why does one photon wind up in an
inner interference ring and one wind up in an outer
interference ring? Nobody knows.

> I reported that the addition of 3 or 4 inches above the coil produces a
> much larger shift in frequency than adding the exact same length below
> the coil [by almost a factor of 100:1]. That is empirical data. It is
> real and measurable.
>
> My question is one of Physics. I think everyone who reads this list
> knows it happens. The real question is: Why?? Why the difference in
> antenna resonant frequency?

I thought my stub examples would answer that question. Anything
done below the coil affects the number of degrees subtracted
from the antenna by the bottom element to coil interface. Anything
done to the stinger affects the number of degrees added to the
antenna by the coil to stinger interface. For a given element delta
length, the number-of-degrees-added effect is greater than the number-
of-degrees-subtracted effect.

Let's take a lossless resonant electrical 1/4WL stub where Z01 = 600
ohms and Z02 = 4000 ohms.

Source-----Z01A-----+-----Z02-----+-----Z01B-----open

Let's assume that Z01A is 45 degrees and Z02 is 45 degrees.
How many degrees does Z01B have to be to make the stub an
electrical 90 degrees long? Hint: 36.5 degrees is lost at
the Z01A to Z02 junction.

Dave Oldridge wrote:
>> My question is one of Physics.

Lest anyone think I have invented something new, I'm sure
Walter Maxwell was doing these sorts of Smith Chart
calculations while I was in high school.

Given the following 1/4WL resonant stub with Z01 = 600
ohms and Z02 = 4000 ohms:

Source----Z01A----x----Z02----y----Z01B----open

Boundary conditions are: The feedlines are lossless. The
source sees zero ohms. The Z01A length is 45 degrees. The
Z02 length is 45 degrees. How long is the Z01B length?

This is a problem easily solved by using the outside circles
of two Smith Charts, one normalized for 600 ohms and the
other normalized for 4000 ohms. The procedure is:

Assuming the source is seeing zero ohms, calculate the
impedance at 'x'. Plot that impedance on a Z02 Smith Chart.
Calculate the impedance at point 'y' of the Z02 length. Plot
that impedance on the first Smith Chart and see how long
Z01B needs to be to reach to infinity.

Cecil, I measured the self-resonant frequency of the loading coils with a Measurements 59 grid dip osc with the coil mounted away from all metallic objects.

The Webster KW-80 coil that measured 14 MHz for the self-resonant frequency, and 8 ohms resistance at 4.0 MHz, as I remember it from several years ago, was about 3" in diameter and around 7 to 8" long. I don't recall now how I measured the Q, but it was close to 400.

I measured the resistance with a GR-1606A RF bridge. If you have a GDO I suggest you remeasure the self-resonant frequency, and then measure the resistance at that frequency with the MFJ 259, and then again at 4.0 MHz. From that data you'll be able to determine the actual Q. Seems like it should be around 500, as Reg calculated. But like I said earlier, I believe the self-resonant frequency of your 6" bugcatcher will be greater than 9 MHz.

Cec,

I would call it the frequency at which the coil alone is resonant when mounted as a base-loading coil over a ground plane.

It would depend on whether the ground plane was a bicycle or the deck of a super-tanker.

Methinks you have left the world of deterministic Physics and moved into Quantum Physics. Such comments do not contribute to the answer. You are not using Quantum mechanics to try to explain to me what is happening. You are using transmission line models. Stick to the transmission line model.

I thought antenna EM Physics was deterministic.

- - - -

RE: your model.

You stated:

"Anything done below the coil affects the number of degrees subtracted from the antenna by the bottom element to coil interface. Anything done to the stinger affects the number of degrees added to the antenna by the coil to stinger interface. For a given element delta length, the number-of-degrees-added effect is greater than the number-of-degrees-subtracted effect."

The 4 inch spring is approximately 0.646 degrees long at 5.3 MHz.

Original: Source-----Z01A-----+-----Z02-----+-----Z01B-----open

Case #1: Source-----Z01A-----+-----Z02-----+-0.646-+-----Z01B-----open

Case #2: Source-----Z01A-----+-0.646-+-----Z02-----+-----Z01B-----open

Z01A has not changed. Z02 has not changed. Z01B has not changed. [The L/D ratios for these components have remained the same and the Zo of each element is therefore the same.] The physical characteristics of 0.646 have not changed. The Capacitance to the coil is the same in either case. Only the location has changed.

Do you claim the complex impedance of 0.646[case 1] is different from the complex impedance of 0.646[case 2]. Why?

Or, do you claim the net Z01B + 0.646[Case 1} is now electrically longer, in degrees, than Z01A + 0.646[case 2]. Why?

Walt,

As I said, I was referring only to the solenoid form.

Below the self-resonant frequency and for some way above it, the distributed self-capacitance is equivalent to a lumped capacitor across the ends of the coil. Coi

Because capacitances between adjacent turns are in series with each other, the capacitance between turns only matters when there are only one or two turns. So, for ordinary proportioned coils, when there are more than a few turns, the self-capacitance tends to become independent of the number of turns, wire diameter and wire spacing.

The wire turns can be considered to form the outside of a Faraday cage.

To calculate self capacitance, consider wire spacing to be zero. When isolated in space we have the capacitance between the two fat halves of a dipole. Which is calculable from length and diameter of the coil, and is equivalent to a lumped capacitance between its ends, which may be used to calculate the self-resonant frequency.

Or the self-resonant frequency can be calculated directly from dimensions and number of turns.

In the past I have measured the self-resonant frequency of coils of all sorts of dimensions. From antenna loading coils, coax choke coils, to 6 feet long, 1 inch diameter, 1000 turns, 160-meter helical antennas. In all cases measurement results agree with the calculating formula within the uncertainties of the measured input data.

Reg.

Thanks, Reg, for the valuable insight. It does pay to read the posts made by one G4FGQ.

If MENSA membership is important to you, fine. Most of us find it a bit pretentious and downright silly.

If someone wants to use MENSA to elevate themselves above the rest, they are perched on very rickety stilts.

Question (this is not a flame):.

1. Is the ability to decode Morse Code transmissions, in one's own wet modem (brain), at high speed, proportional or even relevant in any possible way to one's ability to pass a mensa test and be accepted for membership? Is mensa membership useful? Is mensa membership a measure of Morse wet modem throughput?

Cecil, I think you already answered all of the above as 'no'. That doesn't mean I like the the brand of motorcycle you drive. I do not. I like BMW's that don't require a toolkit for every 100 miles on the road.

2. Or, (as I suspect), is Morse ability only useful after you have purchased one's HF equipment, now that one has passed the test (whose investment you otherwise would not have made until you passed the trivial but compulsory 5wpm test for Morse code proficiency) to have to have fun and prevent future alien attacks?

I am an extra class op who passed 13 wpm several years ago, can do 25 wpm now and getting better all the time just because of heavy (and fun) Morse action on the cw sub-bands, and wanting to know what people are saying and being able to communicate back; in fact, CW is almost as good as psk31.

3. Just the same, how much does this mensa thing cost? Is it worth a dinner for 4?

Rusty, let me answer you this way. In my humble opinion, a MENSA
level IQ is worth magnitudes more to its possessor than is Morse
code skill even within the Amateur Radio Service. If all the coded
hams with IQ's less than 100 were transformed into nocode techs
with MENSA level IQ's, the ARS would be much better off and a lot
less prone to silliness. The ARRL might even stop publishing those
gross technical errors, e.g. reflections don't exist.

If one takes one foot of stinger and transfers it to the
base element section, the antenna length remains the same
and the resonant frequency increases. I assume you already
knew that. So of course, 0.646 is electrically longer when
it is on top of the coil than when it is on the bottom of
the coil. The Smith Chart exercise will show why that is
true.

RE-READ IT - there were TWO people here in the beginning "splitting hairs" about the use of or perhaps MIS use of the word "memorization. One was leaning towards "memorizing" "ANSWERS" purely to satisfy an exam..... i.e; ABCD..... it isn't quite that simple. On the other hand, the other argument was in the "true" sense of the word - TO MEMORIZE (commit to memory for life).

Let me set something straight. "I" was NOT beating my chest about "CODE". I was only in the argument with regard to the use/misuse of the word "Memorization". "I" think code has its place - but not as it once did. It sure isn't keeping the bands clean by keeping it in place. "I" don't use code - that often. I think also, it "can" be fun to learn for those who may want to try it. Some people may - as has been proven, still - others won't - which also has been proven. THAT IS MY stance on code. As to the "mis"spelling of "genius", hey - what can I say - I'm human, I DO make mistakes. I don't rely on "spell check" techniques - so ..... an error does tend to sneak through from time to time. It doesn't matter one iota to me if you do code or not. "I" surely am not here to pass judgement on you or anyone else by that ability or inability (since some DO have trouble getting it). OR lack of interest "may" be more specific. I have quite a few people I talk to on the bands who are "NO CODE Techs. They're not interested in the code - OR wanting to climb any higher in license class. Its cool with me..... That is their thing - not mine. It sure doesn't mean we can't have a decent conversation - be it on the air via repeater, simplex, computer mode or face to face.

:)

Cecil

you're trolling, aren't you?

If you truly believe this stuff, you're in sadder shape than I thought.

Your MENSA membership is dreck, dribble, dross. With code, there is, at
least, some grounding in practicality: a real world function.

"Whew! I knew I was a genius but now I have PROOF!" How completely sad.

MENSA has perverted the very nature of IQ in a manner not dissimilar to
the way Home Owner Associations have perverted the notion of individual
freedoms (guaranteed by our Constitution).

Enjoy your little trophy but I'm sure you'll keep yourself insulated
from the derision you richly deserve when you bring it up in this newsgroup.

I can tell that you're not a bad guy...but, the mensa thing makes you
seem, I don't know, ...(fill in the blank)

Be Good.
Hell, be more egalitarian for once in your life!
We all share a HOBBY!!!!

Those who memorize answers instead of learning concepts - what you
would have seen at the beginning of the thread had you paid attention.

>you tread awfully close to libel there AL

Look up the definition of "libel". Part of it is "malicious
defamation". Calling a penny a cent isn't malicious, nor is it
defamatory.

> ask an lawyer if you don't believe me

You need to take your own advice. Also you need to ask an English
teacher - you don't seem to know the definitions of a lot of very
common words.

There's nothing either malicious not defamatory in that. ("Who" am I
defaming? "Hair"?)

>> But, since you don't know the difference between "learning" and
>> "memorizing", nor which subjects fall into which category, you

2203. performance of Gorge-mounted dipoles?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-14 06:02:45 UTC
From: eternalsquire@comcast.net
Message-ID: <1155535365.682034.199490@m73g2000cwd.googlegroups.com>
Source record: 54640

All,

I have an antenna puzzler for you all.

My trailer is sitting on one side of a 60 foot high mesa resting on top of a vast desert plain.

On the edge of the mesa is a gorge that opens outward, forming a Vee. The two points of the Vee, on the mesa, are about 180 feet apart. The bottom of the gorge slopes gently down to the plain, such that the edges of the Vee are 40 foot higher than the bottom of the gorge, and 30 feet away from where the gorge begins to open from the mesa.

What this means is that I could possibly hang a rope mounted dipole in free space, using guy anchors hammered into the Vee points in the mesa dirt. I possibly could even hang reflectors at the appropriate intervals on either side of the dipole to create a non-rotating wire Yagi.

My question to you all is this: will the antenna's performance be defined by the fact that it is hanging 60 feet in free space over the plain, or will this be nullified by the geometry of the gorge immediately behind and below the antenna?

Keep in mind that soil conductivity is very poor in the desert. I plan on using this for transmitting only, I discovered two lines of wood supported wire fencing on which I could mount lay wire atop for receiving beverages. Each of these lines go on for thousands of feet and cross at right angles only a hundred or so feet from the trailer.

Thoughts?

The Eternal Squire

2204. QFH Antenna and 72ohm TV Coax

I`m building a QFH NOAA weathersat antenna and wish to use low loss t/v coax which is
72ohm; but is more manageable and less lossy at VHF than the 50ohm RG58 specified
over a 100ft run!.... (RF pre-amps aint cheap!).....

What are the pros and cons... can i use CT100 72/75ohm..... i believe i can but, will the impedence affect
the 4 turn choke ????...

Thanks.

It will work perfectly, because the TV coax is good HF quality.

Why do you use a 4 turn choke?

w.

An end fed long wire is your only possibility given the rules you set forth... A 5 to 10 wavelength wire should help... Model it or look in the antenna handbook for the patterns...

However, my "beat the rules instinct" kicks in... What is to stop you from running open wire line a quarter mile out to a vertical? Even if you have to go out after dark and stand the vertical up and take it down at dawn, eh!

They are all entry level. The Extra class license allows
entry into the Extra class frequency segments. An amateur
license is not a status symbol. Its only worth is the
privileges granted. In the 1950's, generals, conditionals,
advanced, and extras all had the same frequency privileges.
I would like to see one amateur license granting all
amateur privileges so this crazy irrational pecking order
nonsense would cease.

Predictable ad hominem comment with zero technical content.

Here's a brain teaser for you, Tom. Assume you have a 45
degree long piece of lossless Z01=50 ohm line and a 45 degree
long piece of lossless Z02=600 ohm line connected together.

1. With the other end open, what is the impedance looking
into the Z01=50 ohm end? How many electrical degrees are
in the stub?

2. With the other end open, what is the impedance looking
into the Z02=600 ohm end? How many electrical degrees are
in the stub?

Hi Lee,

Consider this: If your QFH has a 50-ohm terminal impedance, the mismatch is only 1.44: 1. Therefore, the loss due to the mismatch is 0,14 dB, insignifiant--use the 72-ohm line and forget the miniscule mismatch.

Even if the mismatch was 2:1, the reflection loss is only 0.51 dB.

Concerning the 4-turn choke, nothing happens to the matching operation, because nothing inside the coax changes due to the coiling of the coax.

Walt,

Yes, there is only one G4FGQ. Although I confess I don't spend much
time on the air these days. Poor health!

When it comes to antennas, one reason why I don't publicise the source
code of my programs is that they are full of proven little tricks like
the foregoing which give answers in the right american ball-park.
There is always the danger that unjustified, unqualified criticism
would spoil the confidence and integrity to be placed in them by
novices. If for any reason you don't like a program you can always
have your money back!

One day I might list my 60 years of engineering experience but it may
be construed as bragging.

And a compliment from you, Walt, is a compliment indeed!

Reg.

Hi Lee

There are alot of affordable amplifiers designed for TV that you could use at the base of your QFH. You might consider building your owm amplifier to fit in the base of the QFH.
I wouldnt recomend the use of a pre-amp at the antenna for NOAA satelite station. They often cause more problems than they solve.
All Electronics has alot of ferrite tubes that can be used to fit over the coax so you wouldnt need the "4 turn choke".

Jerry

Hi Reg,

Notice that the purpose of the formula is to get the maximum performance from a finite length of available wire. So it doesn't make much difference what the ground characteristics are..the goal is to put down enough and the right length so that the ground characteristics don't matter any more.

For more detail, go the the url I listed, as it shows the effects of various ground characteristics:

http://www.ncjweb.com/k3lcmaxgainradials.pdf

With this data, the generic formula and your own work, something synthetic could result that is even better than your most recent efforts. It is a VERY interesting subject to those of us using ground mounted verticals.

73,

Should read `Choke Balun`....sorry, my typo...

I`m following a design by Bill Sykes G2HCG & Bob Cobey G0HPO
which calls for RG58 with a four turn choke balun....

I`ll try making the feed RG58 with the choke balun and then feed that with
72ohm...

Thanks....

Reg, I'm curious how you would solve this stub problem
without a Smith Chart.

| 45 deg | 45 deg |
Source====Z01=========Z02====open

Stub sections are lossless. Z01 = 600 ohms and is 45
degrees long. Z02 = 50 ohms and is 45 degrees long.
What is the impedance looking into the stub from the
source?

Thanks Cecil, this is my second QFH !!!
the first worked a treat as designed with RG58, but 100feet is a bit
lossy.....
a preamp under pmr towers is asking a bit too much hence tv coax.....

2246. Bio-TERROR in America: Aerosols for HARM and Torture!

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-14 16:18:25 UTC
From: nanovmh@yahoo.com
Message-ID: <1155572305.451124.21260@75g2000cwc.googlegroups.com>
Source record: 54583

AMERICA IN DANGER of its own loose Bio-Terror: Is 1984 here?
Secret Bio-Aerosols are misused to HARM and Torture in U.S.A.

CRITICS (political/social/cultural) are harassed and secretly
persecuted
along with their KIDS in schools/colleges, especially, during
tests/exams
(Think of Guantanamo Bay "stress-positions" in 1984-technology context)

Bio-Aerosols and aerosolized chemicals are used to cause:
- severe colds/coughs turning into bronchitis, eye irritation
- bacterial pneumonia/other pneumonia, shortness of breath
- surges of severe headaches, migraines, dizziness, etc.
- fainting collapses by symptoms-mimicking aerosols
- severe stomach pains (sharp, burning, nausea, etc)
- chest-wall pains, heart-muscle inflammations, etc.
- heart attacks under cover of second-hand smocking
- car crashes/accidents by Vertigo-causing aerosols

A network of Secret Gas-Aerosol Rooms operated in US
(in Philadelphia, Narberth, Lower Merion, PA)
(in Wilmington and Newark, DE)
(in Hampton, Williamsburg and Richmond, VA)
AND ELSEWHERE.... details below...
Bio-aerosols used to hurt and simulate panic attacks, etc.!
Soviets locked critics into nut-houses, now WE do the same!
Symptoms-mimicking aerosols do HARM, weak or ill people.

Say "Stop, I care" - call Senate (202) 224-3121
House of Representatives (202) 225-3121
What IS going on in America? *Print and Post*

Big Brother spins protection...
And fear is used to clamp.
Democracy needs action!
On which side do you stand?

Looked at this?!! Go to Google/Yahoo newsGroups:

TORTURE IN USA: Secret Aerosol Rooms

US Scientist needs legal help dealing with the secret aerosols rooms
(SARs) operated illegally in Philadelphia area, Newark (DE), Hampton
and Williamsburg (VA) and other places. Highly volatile aerosols with
and without bacterial content cause dry cough, airways a...

Full text was at:
http://buyit.philly.com/findit/search/results.jsp?catId=krd_philenqda...

This was a new on-line ad placed in Philadelphia Inquirer and
Philadelphia Daily News on www.philly.com (see full text below)
It was about the secret aerosols rooms in US. One could find it by
searching "secret", say, in the ad section of philly.com.

Democracy can not function effectively without the informed public. As
a former NASA Langley scientist working in the area of nanotechnology
and nanoscale particles, I have been recently exposed to the
establishment of secret gas-aerosol rooms inside of United States, at
least in the Mid-Atlantic region (from Philadelphia to Virginia).
First, the highly irritant aerosols have surfaced at the NASA Langley
Research Center in several safety accidents. Investigations were
blocked, probably, because of lack of Congressional approval for such
financially-lucrative research at NASA. Later, these aerosols had been
encountered outside of NASA in Virginia, Delaware and Pennsylvania
.
This points out to yet another proliferation of originally-sensitive
technologies into domestic American life to hurt and harass people
without a proper oversight and much control. This amounts to torture,
extra-judicial prosecution and authoritarian intimidation tactics. The
use of such irritants and the operations of the secret gas-aerosol
rooms are gross violations of human and constitutional rights of
American citizens and various domestic and international laws.

------------------Full text of an ad from Philadelphia's
philly.com--------------------------
TORTURE IN USA: Secret Aerosol Rooms
US Scientist needs legal help dealing with the secret aerosols rooms
(SARs) operated illegally in Philadelphia area, Newark (DE), Hampton
and Williamsburg (VA). Highly volatile aerosols with and without
bacterial content cause dry cough, airways and eyes irritation, chest
pain and inflammation. FBI and Homeland Security associates are likely
operators of SARs, while collaborators may be hotel staff and
landlords, who get financial/material or other incentives. US citizens
and kids are victims.

AMERICA IN DANGER!

America in danger -
The vice is NOT impeached.
America in danger -
The public trust is breached.

Big Brother spins protection...
And fear is used to clamp.
Democracy needs action!
On which side do you stand?

Which side are you on, boys?
Which side moves you on?

Which side are you on, girls?
Which side moves you on?
(Chorus after F. Reece)

Your church is burned by haters.
The priests to go to jail?
Your dreams are cheyned by traitors,
But hope still shines through veil.

"Dust rooms" came back to gas us
With neo-Naz (or Con) embrace...
New immigrants do make US!
And not the SSuper-race...

2247. Antenna question about above ground term

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-14 17:12:24 UTC
From: MRW <mr.whatever@gmail.com>
Message-ID: <1155575543.996352.151110@b28g2000cwb.googlegroups.com>
Source record: 54584

Hello folks,

I was reading this website:
[url]http://www.qsl.net/aa3rl/ant2.html[/url]. It got me thinking. In general, does the term "above ground" refer to the actual Earth ground or does it refer to an antenna's ground plane (not necessarily Earth ground)?

I was looking at the radiation patterns, and I got curious what would happen if a dipole antenna is attached to a bird (for example). Will the radiation pattern change as the bird's flying height changes? Or will the flying antenna maintain the same radiation pattern as a "normal" antenna that is mounted on a mast at the same height?

Thanks!

>would exclude a lot of people besides me and kill the ARS

Like it was "killed" all through the 30s, 40s, 50, 60s, etc.? Code
was required, as was drawing schematics. Yet there were more hams
every year than there were the year before. You have a strange
concept of "kill".

>myself for example by comparing me to a theft

1) A theft is an act - I wasn't comparing anyone to an act.

2) Quote where I'm comparing you to anything.

>>Telling you something true about yourself isn't actionable, unless
>>done with certain intent, which you'd be hard-pressed to prove.

>never said it was actiionable

You keep using the word "libel" - that means actionable, since libel
is a civil tort.

>do you understand english it seem not

Oh, I understand it. It's difficult to get published if you don't
understand the language in which you're writing. Your posts, however,
demonstrate a clear lack of ability to use the language to communicate
clearly.

>however when you keep compating someone to theifs in time I suspect it
>would rise to being actionale

If I ever did, which I never have.

>what protects you is that judgement is not particularly collectable
>and therefore not worth an atorneys time

How would you know whether a judgment against me is collectable?

Or is this another case of what you say having nothing to do with what
you mean?

My statement if you enacted a standard that would in fact keep me from
passing, that would kill the ARS. That sort would require far more
than merely adding schamtics or going to short answer questions. it
would involved a test that would serious chalange Cecil and Len
Anderson both RF engineers, doing that would kill the ars as would the
asiine proposals of Mr Slow Code and many others

your notions are simplely not exexutable in anything like the current
sytem

the notion that multible guess is acceptable for pilots and drivers
(amoug others) but ham radio ops is silly

As far as I know, there is no governmental PhD class
license and therefore no governmental ranks of those
with PhDs.

>> An amateur
>> license is not a status symbol. Its only worth is the

You don't seem to know much about 1950's ham licenses.
You didn't know that Conditional was a General exam
taken by mail. You don't know there were many Advanced
class hams in the 1950's faithfully renewing their
licenses. My Elmer was an Advanced licensee. Here's
a quote from a 1957 ARRL License Manual: "Holders of
Advanced Class licenses may renew them so long as they
can comply with renewal requirements."

Lee,

It is easy to build a preamp with high gain and low noise figure and
it will exhibit superb performance on a test bench in a shielded room
on a signal generator.

In a real world environment, you are unlikely to realise the full
sensitivity of the receiver due to:
- external noise; and
- intermodulation products generated within your receiver (preamp).

It is harder to build a preamp with low intermodulation distortion,
and one method of reducing the results of that intermodulation
distortion is front end filtering to reduce the level of undesired
signals reaching the non-linear devices.

Front end selectivity costs much more money than a low NF preamp
transistor or gasfet.

Whilst wideband preamps are available at low cost, it is quite likely
that they will actually degrade your receiver performance.

It may even be that adding an external filter will improve your S/N
ratio.

An interesting test to perform is to note the S/N ratio, add a small attenuator to the receiver input, and again measure the S/N ratio. If the S/N ratio improves, it is an indicator that you have significant intermodulation distortion and front end filtering may improve the sensitivity.

I listened last night and could hear NOAA 14 on a hand held scanner (IC-R20) with a 130mm long rubber duckie off my 2m transceiver. It wasn't good enough for pictures, but it could be heard... so it shouldn't take a lot of receiver sensititivity to decode it well. (BTW, I could not hear the bird using a 200mm whip on the scanner... to much noise from intermod products).

I know you asked about coax and you are seeking a low loss coax situation, coax loss might be less important that adequate receiver front end filtering so that you can realise most of its potential in the presence of other strong signals. In the absence of that, coax loss might actually improve S/N!

Owen

PS: I recently performed some tests on the new Icom IC-7000 on 144MHz to determine the usable sensitivity on a wideband antenna, and although the specified sensitivity is -126dBm, the sensitivity when connected to a Diamond D-130 at this location was -96dBm, that is 30dB poorer than spec, and the main contibution was IMD within the IC-7000. Putting a 10dB attenuator inline improved the sensitivity by 14dB!

I missed the significance of this problem Cecil.

Is it principally a theoretical (being lossless) problem that a Smith chart can solve, or does it have some other significance?

Whilst a Smith chart is great for visualising transmission line problems, a great way for visually mapping impedance over a range of frequencies, it isn't the most practical way to solve practical problems when we have access to the computing power commonly available to designers today.

Owen

PS: I think the problem you have given can be solved with simple trig: find the reactance of the Z02 section using one trig term, find the length of Z01 that would deliver that reactance using one trig term, add that length and the actual length of Z01 section, find the reactance of the Z01 section using one trig term. I could do that in a flash with a scientific hand calculator while you were sharpening your pencil.

It is a trivial problem either way, and can only ever be an approximation of a practical problem.

Hi Owen

Not that it makes alot of difference, but, you could have been hearing
NOAA 17 on 137.62. Its coordinates may have been different from where you
were anticipating while orienting your 200mm scanner whip.
And, as you probably know you'll need about 30 KHz minimum if you want to
produce images from the NOAA satellites. I think the IC R20 selectivity
is either too narrow or too wide for producing APT images even when the
signal strength is adequate. But, you probably knew that.

Jerry

It was actually NOAA 15 that I heard (sorry for the typo) and I was
listening to the APT signal on 137.5MHz in USB mode. I am pretty
confident it was the bird, the doppler shift changed direction at the
right moment.

I was more interested in the strength, I couldn't find a ready source
of link budget calcs on the 'net.

2295. US Scheme Could Affect Global Communications

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-15 01:06:45 UTC
From: Licorice <Candy@Licorice.com>
Message-ID: <12e27h5q0abe83e@corp.supernews.com>
Source record: 54532
Cross-posted to: rec.radio.amateur.antenna,rec.radio.shortwave

US satellite protection scheme could affect global communications
http://www.physorg.com/news74778465.html

A proposed US system to protect satellites from solar storms
or high-altitude nuclear detonations could cause side-effects
that lead to radio communication blackouts, according to new research.

If activated, the "radiation belt remediation" (RBR) system
could significantly alter the upper atmosphere, seriously
disrupting high frequency (HF) radio wave transmissions and
GPS navigation around the world.

The remediation system aims to protect hundreds of low
earth-orbiting satellites from having their onboard electronics
ruined by charged particles in unusually intense Van Allen
radiation belts "pumped up" by high-altitude nuclear explosions
or powerful solar storms.

The approach, which is being pursued by the US Air Force
and the US Defense Advanced Research Projects Agency,
involves the generation of very low frequency radio waves
to flush particles from the radiation belts and dump them
into the upper atmosphere over one or several days.

The scientific team from New Zealand, UK and Finland
calculate that Earth's upper atmosphere could be dramatically
affected by such a system, causing unusually intense HF blackouts
around most of the world.

The disruptions result from a deluge of dumped charged particles
temporarily changing the ionosphere from a "mirror" that bounces high
frequency radio waves around the planet to a "sponge " that soaks them up.

The research is published in the August edition of the
international journal Annales Geophysicae. The researchers
suggest that policymakers need to carefully consider the
implications of remediation.

If the intense radiation belts resulted from a rogue state
detonating a nuclear-tipped missile in the upper atmosphere,
using such remediation technology would probably be acceptable
to the international community, regardless of any side effects.

However, using the system to mitigate the lesser risk to
satellites from charged particles injected by naturally
occurring solar storms should be considered more closely.

The impact of the disruption to global communications needs to be weighed carefully against the potential gains.

It's just a mental exercise with a hidden significance. This
is the type of problem that I would solve with a Smith Chart.

How about a solution? What impedance does the source see? The
physical length of the stub is 90 degrees. What is the electrical
length of the stub in degrees?

Klein, you said you were an OF. Any olde-fahrt ought to KNOW that
silver-mica capacitors were color-dot-coded for about a quarter
century. [look in the 1976 ARRL Handbook] Those flat cases
were eventually displaced by dipped silver-mica.

Paper tubular capacitors in molded plastic tubular casings were
marked with color bands and were on the market for at least
15 years, maybe 20...until aced out by ceramic disc capacitors
for general bypassing and coupling applications (by both tube
and transistor architecture electronics).

ANYONE with hands-on experience in electronics between 1950
and about 1970 would KNOW that. [okay, folks, looks like
there's another imposter here...at least this one isn't
trying to pass hisself off as some marine NCO...:-)

You are still using crayons but I doubt you know how to
use a 1950 slide-rule...too complex for brass-pounders.

Oh, and FCC Field Offices were NOT 10 miles apart in the USA
now, in 1956 (when I took a train 80 miles into Chicago), nor
before then.

>Then we'd wait 3 years to receive our license which gave us time to
>teach electrons to enter and exit all the tubes...stupid little buggers,
>those.

Wrongo, olde-fahrt. Electrons, fields, and waves will ONLY
obey THEIR rules. You can't "teach" them anything. All you
can do is provide paths for them...on THEIR terms.

>Boy, those were the days. When a ham was a ham, brass was for pounding
>and AM signals were as wide as the day is long.

That was well before 1960...like before WW2.

>These "young" whippersnappers get off too easy.

Pizza off, olde-fahrt. 51 years ago I would be walking a mile
from a corner of an airfield NE of Tokyo to the transmitter
house in the center which housed 41 HF transmitters ranging
in power output from 1 KW to 40 KW. Not a single one of
them used manual (morse code) radiotelegraphy modes. About
two square miles of wire antennas doing 24/7 radio circuit
transmission to CONUS, Hawaii, Phillippines, Okinawa, Korea,
and a MAG in Vietnam. Six of those circuits used multichannel
SSB (the commercial variety, like in-use prior to WW2).

I STARTED that HF transmitter site work in '53, NO military
schooling on kilowatt transmitters, RTTY, or SSB and NO
"CW" skill necessary.

>I say, rank priveleges on the basis of how big an RF burn you can take,
>or on the basis of personal weight.

Sounds like you had TOO MANY of those "RF burns."

See Dr. Robeson in here...he will bandage your "burns" with
one of his medical-practice certificates...those are sterile.

>I may have said it before: take the FCC out of it completely and go with
>the FDA. Those boys know how to grade.

"Ham is the butchered meat of swine?"

Last guy I heard utter that phrase is SK...used to work with him
(he was a code-tested Extra)...he came out with that every once
in a while when some amateur morseman got too full of himself.

>(Too much tea this morning!)

Try a detox program, okay? QRT.

If MORSEMANSHIP is important to you, fine. Most of US find it a bit
pretentious and downright silly.

If someone wants to use MORSEMANSHIP to elevate themselves above
the rest, they are perched on very rickety stilts.

[I'll just add something like...]:

Stilts are needed by morsemen because their appearance, relative
to REAL radio people, are very short. They try to gain "height"
of their reputation by using 1930s standards in the year 2006.
Tsk, they don't realize that their new "height" still falls
short of everyone else...

Since you couldn't pass a final in a high school physics class, you
aren't qualified to determine what someone with an earned EE could or
couldn't do. As one who earned mine, I am.

>the notion that multible guess is acceptable for pilots and drivers
>(amoug others) but ham radio ops is silly

So you don't understand the difference between "choice" and "guess".
We'll just add that to the *L*O*N*G* list of things you don't
understand.

So we have to give everyone a driver's license, even those who can't
drive? And let everyone vote, even those who are mentally
incompetent? No discrimination based on anything?

The Constitution doesn't prevent us from imposing standards, Markie.
And the law certainly doesn't guarantee that we're all equal, only
that we all be given equal opportunity to EARN what we want. There's
no Constitutional guarantee that the government will give us
everything we want, or that it can't treat different people in
accordance with those differences.

gee I got an an A in My HS physics class and for that matter a B in my
course physics course on E&M theory I certainly am quailified

again BTW you imply I cheated or somehow did not earn mine I did did I have to work as hard as you maybe not but then I don't think You should have had to work as hard as you did I regret I can' change that for you but the I did so you must BS is not going to carry on if I can help it

lets not you want to tkaet the same notion into Radio why not hold
pilots to same sort of stanards as Radio Ops after flying is a bit
more dangerous

>
>So we have to give everyone a driver's license, even those who can't
>drive?
no becuase driving is dangerous peotcaily ham radio is not

furtehr what evidence do you advance that Higher make beter radio ops

indeed you reject the notion that higher IQ means much of anything
> And let everyone vote, even those who are mentally
>incompetent?

most esp we should not restrict the mentaly imcpomtant form from
voting since the likely result in time is everyone being declared so
> No discrimination based on anything?
not on something un related to the matter being regulated

Morse Code was never vital for Hams to be operate once we had voice we
could have done away with such testing (aprt from the treaty) the
requirement for Morse being to avoid the military on cw would have
meant a voice that could read code would simply have to qsy everytime
he heard CW)

today theere is NO requirement for CW testing. It is not needed that I
know CW in order to operate at all. Indeed even if we don't stick to
band plans I don't need to be able read a CW signal to know it is
there, and reconize the frequency is in use
>
>The Constitution doesn't prevent us from imposing standards, Markie.

can't you show enough manner to call me by my name which is Mr Morgan
since I gave you no leave to address me familier

>And the law certainly doesn't guarantee that we're all equal, only
>that we all be given equal opportunity to EARN what we want.
and that anything in our way must relate to matter being regulated

no harm will result if I don't know Morse code many hams ven now on HF
don't know it well enough to use indeed there was never a test to
determine if we could use it on the air at all

I expect the Govt not to require mye to demstrate a skill that is
completely uneeded in order to access public airwaves

the FCC (and I et al) have regrected as false all the arguements that
Code testing makes one a better operator

you have advanced no real reason why I need to know without looking ti
up whattype of occiclator a given circut is

you adavnce no answer to how we would insure that the tests you want
to see are fairly given and graded accross the country
> There's
>no Constitutional guarantee that the government will give us
>everything we want, or that it can't treat different people in
>accordance with those differences.

no one is asking the govt me everything we want or the rest of the
nosense you are spouting

Hi Cecil

Is it posible that the length of the "stubs" change? I'd have thought the
length of the stub is always the same. 45 degrees should always be 45
degrees, shouldnt it?? An open circuit, 45 degrees back along a 50 ohm line
looks like 50 ohms capacitive. That 50 ohms looks like something like 500
ohms inductive as viewed 45 degrees back along a 600 ohm line.
I'd guess your point is that 500 ohms of pure inductive reactance is never
seen 90 degrees back from an open, no matter what the Zo of the line

Jerry

UNTIL the Code requirement is abolished for good - which to my
recollection - it has not for U.S. hams (yet), then to get on H.F. you most
certainly are required to pass the 5 WPM code exam.

> no harm will result if I don't know Morse code many hams ven now on HF
> don't know it well enough to use indeed there was never a test to
> determine if we could use it on the air at all
>

Also, I think if you read Part 97 - you may be surprised. VEs can give
either a receiving test OR "sending" test. USUALLY (most of the time) - it
is a "receiving" test. Whatever it takes for them to have "the examinee"
prove his/her knowledge of the code at 5 WPM. For example, you could claim
tone deafness to me - ok - so instead of "receiving" the code, I could have
you "send" the code. Before the code dropped to 5 WPM - you could get a
doctor to sign a waiver and you got code credit. BUT once the code was
dropped, so too were the waivers. I know it may sound hokey to have you
"send" code if you claim tone deafness, but the other options are a buzzer
sending YOU the code - you decipher - or a flashing light or whatever. AND
the FCC stated to the VEs that THOSE claiming handicaps are the ones
responsible for supplying the equipment to enable them to have every
reasonable chance of passing. Also, that code test "could" be broken down
into segments. Instead of playing a tape with a full message as you would to
most applicants, the VEs could break it down in segments of letters, words,
sentences at a time for someone with severe handicaps. WHATEVER was able to
give that applicant every reasonable chance of passing without much stress.
Argue that with THEM - "I" didn't make the rules.

So, just when was it that CODE was "abolished" as an "Exam" requirement?
Maybe I missed some mail from the VECs and FCC to tell me to quit testing
for 5 WPM code to get on H.F. ..... You give me a date that it went
into effect, and I'll retract my post.....

OK, I'll buy that - but again, until the code {exam} is "ABOLISHED" - we are
"required" to have it for H.F. I WILL agree, once many pass their code
exams, they never see a key or listen to a code tape - again...........

For what it is worth and THIS I've not kept up with - I have heard that
there is a move afoot - by the FCC themselves - to abolish the code
requirement. For some strange reason, September or October of this year
comes to mind. I guess we'll have to wait and see.

The point I'm eventually going to make is about loading coils
in mobile antennas but let's stick with the above stub example.

```
| 45 deg | 45 deg |
Source====Z01=========Z02====open
```

Z01 = 600 ohms, Z02 = 50 ohms

If the Z0 were constant and the stub was 90 degrees long,
the source would see zero ohms. Yet in our above example
the stub is physically 90 degrees long and the source sees
+j500 ohms. The above stub is electrically 130 degrees long.
There is a 45 degree delay through the Z01 section of stub.
There is a 45 degree delay through the Z02 section of stub.
There is a 40 degree phase shift at the Z01 to Z02 junction.

If we want to turn the above stub into a functional 1/4WL
open stub such that the source sees zero ohms, we can
remove 40 degrees from the Z02 section. If we make the
Z02 section 5 degrees long, the entire stub will be
electrically 90 degrees long, and 1/4WL resonant.
There will be a 45 degree delay through the Z01 section
There will be a 5 degree delay through the Z02 section
There will be a 40 degree phase shift at the Z01 to Z02
junction.

Hi Cecil I sure dont want to get involved with any mobil antenna loading
coil discussions, I admit that I'm not qualified.

Yeah, but is isnt a line with a constant Zo

> Yet in our above example
> the stub is physically 90 degrees long and the source sees
> +j500 ohms. The above stub is electrically 130 degrees long.

I'd disagree with a conclusion that, just because the impedance seen by
the source is 500 ohms, the line connecting it to a load is 90 degrees
long.

> There is a 45 degree delay through the Z01 section of stub.
> There is a 45 degree delay through the Z02 section of stub.
> There is a 40 degree phase shift at the Z01 to Z02 junction

If I disagree, do I have to get involved with some lengthy mathmatical
discussion? I'm not skilled enough to argue with you Cecil. I'm not even
smart. But, I sure dont see how anyone can conclude there is a phase shift
at the junction of two transmission lines. There is a shunt capacitive

reactance that results from that abrupt change in dimensions, but I wouldnt have thought it would be enough to result in 40 degrees of phase shift.
.

I think I agree with the concept you are using. You are giving the condition where a purely capacitive reactor of 50 ohm impedance is required to be resonated by introducing a series inductor. A short length of higher impedance transmission line will sure do that. The higher the line Zo, the shorter it needs to be to resonate that 50 ohm capacitor.

2343. What is wrong with Hawaii, Alaska, and Canada

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-15 08:39:34 UTC
From: Paul Hinman <paul.hinman@shaw.ca>
Message-ID: <aLfEg.400583$Mn5.137675@pd7tw3no>
Source record: 54479
Cross-posted to:
rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.amateur.equipment

I frequently see postings in the ham radio related newsgroups for items currently being offered on E-Bay.

All to often I that items will be shipped only to the lower 48 states, leaving hams in Hawaii, Alaska, and Canada out of the picture. What is the problem. In Canada we are well served by FEDEX and the United States Postal Service. Amateur radio equipment crosses the border with out any problem. I realize that Hawaii and Alaska may be a bit far from the "lower 48" but the same delivery services are available even though surface transportation may be a little bit slow. In the US you also have UPS, the folks in Brown which we Canadians prefer not to use because the often make the border crossing more difficult than it needs to be and we don't like getting stuck with brokerage fees.

So why the discrimination, if the buyer knows that delivery may take a little longer and is prepared to accept the fact then it becomes a non problem. If the seller is intimidated by the prospect of complicated paperwork, he needn't be. Please leave it up to the buyer to decide whether he wants to bib or not.

I can not speak for shipments to Europe, Africa, India, China, or the South Pacific but for fellow Americans, or friendly northern neighbours, I think that people should be prepared to deal with us.

Thanx for letting get this off my chest and I realize that I have cross posted this to four different newsgroups but I wanted to get to a broad audience.

Paul

news:aLfEg.400583$Mn5.137675@pd7tw3no...
I frequently see postings in the ham radio related newsgroups for items
currently being offered on E-Bay.

All to often I that items will be shipped only to the lower 48 states,
leaving hams in Hawaii, Alaska, and Canada out of the picture. What is the
problem. In Canada we are well served by FEDEX and the United States Postal
Service. Amateur radio equipment crosses the border with out any problem.
I realize that Hawaii and Alaska may be a bit far from the "lower 48" but
the same delivery services are available even though surface transportation
may be a little bit slow. In the US you also have UPS, the folks in Brown
which we Canadians prefer not to use because the often make the border
crossing more difficult than it needs to be and we don't like getting stuck
with brokerage fees.

So why the discrimination, if the buyer knows that delivery may take a
little longer and is prepared to accept the fact then it becomes a non
problem. If the seller is intimidated by the prospect of complicated
paperwork, he needn't be. Please leave it up to the buyer to decide whether
he wants to bib or not.

Paul

Don't feel too bad, Paul. You'll often notice in the same listings that
(even if they ship solely by USPS) they will not ship to US military APO/FPO
addresses, either. We get left out in the cold even more often than any of
the above named locations. So much for supporting the troops as it were.--

USPS Air to South Africa takes 4 days from California. Customs is handled by them and it is extremely easy to use. Great service.

Americocentric sellers maybe?

Hmmm???

Hawaii is too hot?

Canada is too big?

Alaska is just right!!

But this doesn't respond to the hypothesis.

John, I like your radial plugs... Good creativity...
Strapping the antenna to the wood shed will not affect the tuning...
So what are you guys going to measure? Gain/impedence/current drop
across the inductor/?
Are you going to elevated radials?
There are a few easy ways to make capacitors... Early on they lined
mason jars with foil inside and out... Not tuneable but can be
swithced in and out to provide the bulk of the capacity and then a
small variable cap in parallel for tuning...
(I only thought of the banks of mason jars the instant I typed this...
I don't know what the capacity would be but they will take a heck of a
lot of voltage before arcing.. I will have to do that at home and
measure)
Anyway, you can stack up two or more 8X10 copper PCB and put Saran wrap
between them Won't take a lot of voltage but may be OK for 100
watts... You can order thin sheets of Teflon to insulate the copper
sheets... This will make a high voltage insulator for a capacity
pile... You can adjust the capacity by sliding the plates across each
other... Another way to tune would be a hinge so the plates are like
butterfly wings...
I vaguely remember someone, somewhere, published an article about ahigh
power tuner he built with the capacitor being two copper sheets
separated by thin glass... He used a threaded rod and a gear motor to
slide the plates back and forth... Had limit switches, automatic motor
reversing, yadda, yadda... TOo much work for a quick-n-dirty
experimentor like me...

Another way would be two aluminum tubes that just fit inside each other
with Teflon insulator... Sliding these in and out like a trombone will
change the tuning... I have actually done this.. Keeping the internal
spacing even is difficult and the insulator seems to want to bunch
up... Probably a pile of plates is better...

That's because shipping to an an APO/FPO is no longer a service provided by the U.S. government. At one time mail to an APO/FPO was delivered to a U.S. millitary post office that then shipped it using U.S. milltary transport, There was a good chance that the mail would actually arrive and it would be undamaged. Now APO/FPO mail is sent via the regular postal system, but the U.S. government picks up the tab.

Now, the chance of the mail arriving is much less as it stands out.

As for Paul's comments, they really don't hold any water. Small sellers don't ship outside the continental U.S. because they don't want the risk.

If an item is lost, stolen, damaged, or takes a month or two to get delivered, they can't afford to replace it, or "eat" the loss. Paul even has more problems because Canadian customs may hold an item to determine its value, or if it can be legally imported as long as they wish. They can also assess the value for sales and other taxes.

Obviously he never has had any experience clearing an item through customs. If he had he would have praised the low fees, speedy processing and general reliablity of the courier services.

Considering the general quality of things sold on eBay, the sellers are actually doing you a favor. While many of the sellers will attempt to keep you satisfied, if you have to wait a month for something to arrive and in Paul's case pay GST (general sales tax), import duty and customs clearing fees, then have to send it back, he would loose a lot.

Besides paying for shipping both ways, he would have to pay customs clearing fees at the U.S. border and prove that the item he is sending back was actually being returned to the U.S. as a defective purchase and not scamming the customs people by claiming it was.

This means that some items both of you either have to keep or pay for and never get no matter what it costs. Where do you draw the line? $100, $200, $500? If it costs $100 to ship a radio to you and $100 to send it back, it does not make much sense.

Geoff.

Been here six years, and have NEVER had anything shipped to me USPS that
hasn't gotten here, and if it was properly packed, it has always gotten here
in one piece. I pay for Priority Mail shipping, which now is only a dollar
or two more than Parcel, and I get it here in a week to 10 days.

And actually, the USPS takes our mail as far as San Francisco via regular
channels, and from there it's shipped commercial air (just like any other
air mail) to our local APO hub, and then to the mail rooms.

I am probably showing my age but as a kid I recall the console radios with a very cool tuning indicator called a Cat's Eye.

Some things are gone forever and are missed. Too bad there is not a software version of the old cat's eye.

I know the spacing will be wider, but can two pipes with a PVC pipe
between make a usable capacitor? i.e. 1/4 od metal pipe inside 1/2 od
pvc, inside 3/4 id metal pipe. (numbers are fictitious, but you get
the idea.)

>
> But you wouldn't get that accuracy from the Smith chart.

Thanks very much, Owen. I used the Smith chart to get 85, 130,
and 500 above. That's about as good an accuracy as I ever need.
Also MicroSmith says the impedance value is j507.2 ohms.

The stub, which is 45+45 = 90 degrees physically, is electrically
130 degrees long. There is an ~80 degree shift in the Gamma angle
at the 600-->50 ohm impedance discontinuity resulting in ~40 degrees
being added to the electrical length of the stub by the impedance
discontinuity.

Let's say we now want to turn that stub into an electrical 1/4WL
stub. If we made the two sections the same number of degrees,
how many degrees would they occupy?

```
| X deg | X deg |
source====Z01=========Z02====open 1/4WL stub
```

where Z01=600 ohms and Z02=50 ohms

I get 16.1 degrees for X. A stub that is physically ~1/12WL
long is 1/4WL resonant, i.e. a 90 degree phase shift from end
to end. Does this remind anyone of a base-loaded mobile antenna?

Well, it is physically 90 degrees long because the two
physical pieces are physically 45 degrees each. That's a
given. However, the +j500 result tells us that it is
electrically 130 degrees removed from the open circuit
at the far end.

> smart. But, I sure dont see how anyone can conclude there is a phase shift
> at the junction of two transmission lines.

There is an abrupt change in the Gamma angle of the reflection
coefficient at the impedance discontinuity. I can show you why
on a phasor graphic. Simplified, it goes something like this.

Itotal = 21.5*sin(25) = 10*sin(65)

where 21.5 is the phasor amplitude of the current in the 50
ohm section at the junction and 10 is the phasor amplitude
of the current in the 600 ohm section at the junction.

The values must be the same even though the magnitude of Z0,
which controls the amplitude of the current, has changed.
If those values must be equal and the amplitude changes because
the Z0 changed, the only other thing that can change is the
phase angle.

[snip]

From what I've read, ideas such as this have been floating around for years.
This is one of the experiments in the HAARP project.

Back in the 60s, there was even a fix-it proposed for the post EMP
ionosphere. They'd shoot a rocket to the upper atmosphere and explode a
charge to spread millions of tiny copper wires to restore reflectivity.

I remember my grandparents having such a device on their big
living room radio set. I also remember opening the back of a small table
model radio when I was older (in my teens) and being surprised
to find that one of the tubes used in it had a catseye on it. Guess they
were using an old stock of tubes in the new radios and the catseye tuner was
just an unneeded function of the tube they used.

Unfortunately many Public Utility Commissions have decided to opt out
of the argument by declaring that the problem is a Federal one. The
Indiana Utility Regulatory commission is one such.

Please re-size your JPEG's. You are formatting them as 740x550, but you are forcing folks to download images that are 2048x1536 -- approx. 8 times larger than neccc.

Not everyone is on fiber, cable, or DSL. (Even on caable, it was a slow load.)

Thanks
Jonesy

The only possible problem is loss or damage. USPS air delivers in a few
days and for a reasonable border fee, most of which is sales tax at this
end. If the customs declaration is made out properly, stating that the
contents are amateur radio equipment and if the eBay auction price is
stated as the value, there is rarely any problem unless the merchandise
is misrepresented in the first place. There is no duty on amateur
equipment entering Canada from ANYWHERE, just sales taxes.

My recollection is that it was called Magic Eye tuning. Maybe
different manufacturers used different names.

I recall listening to the hiss of CW in a BFO-less wooden box radio
with the magic eye winking in time to the Morse.

Looking back, it seemed like a kind of expensive gimmick in a day when
squeezing maximum performance out of the minimum number of tubes was
the norm.

It depends on how you define function!

To tune a dial and watch that green eye close up is ... well ... nostalgic.

Takes me back to 'Gooney Boxes' [the early models].

Yep!

And, you can pay someone to do it for you!

And, if you are an ARRL member they will also do it for you.

Hi Cecil

Thanks for pointing me toward learning about reflection coefficient. I am really surprised that there is such a large amount of phase shift at that junction.

So paint the S-meter needle and 60 dB over S9 a
phosphorescent green color? I'm sure the display
on my IC-756pro could have been programmed to
simulate a "Cat's Eye Tuner". Maybe someone should
notify ICOM that it should be a feature? :-)

What I did to renew mine:

Go to the FCC website. Find the section on renewing amateur licenses.
You can download form 610. What's easier, tho', just call the FCC
phone number they give you, tell them you're renewing, the next day or
so you will find form 610 and all instructions in your mailbox, free
of charge. Fill the stuff out and send it in.

The FCC may have a minor charge for renewing, I forget.

If you've changed your address since getting your license, you may
have to register the new address with the FCC before renewing. You can
do only one thing at a time on form 610, as I recall.

W8JI has theorized an even larger phase shift there at the
junction of a loading coil and the stinger of a mobile antenna.
Unfortunately, he attributes 100% of the phase shift below
the stinger to that single junction point, while ignoring
the phase shift provided by the loading coil. This thread
is my attempt at setting the technical record straight and
correcting W8JI's new old wives' tale. This discussion
started years ago on QRZ.com where both sides were wrong
and nobody was 100% technically correct, including myself.

The purpose of the whole thing is just a series of lab projects to better understand what I think I know. I went into this thinking that I could match up 160M with just a larger coil, it is not so! The TLW software, EZNEC and G4FGQ's programs are very clear on that subject.

I work in a frenzy for a while on given parts of the antenna and then sit back and digest what I have done.

I will first scrounge around a bit on the capacitors and see what I may have stashed away before I spend too much effort fabricating anything. There is a pretty good chance I can get away with some low voltage stuff if I limit my testing to the MFJ 269 Analyzer. That is probably the way to go. Also, there is no real reason to run 100 watts to test.

I have not tried the Mason jars since I was about 12 years old but it did not work out well then. I think the glass is too thick!

I think any performance measurements are well beyond my resources. So far I have not used more than three radials but that has been enough to convince me that an emergency antenna is easy to assemble.

It was a 6E5 vacuum tube. Great indicators and they were driven
by the AGC voltage.

Been there, done that, I think I remember the tube type was a 6E5.

I don't miss it at all!

My idea of cool is the Ten Tec Jupiter on my desk beside my computer.
It has a panel and a computer display, instant warm up no drift, more
filters than I will ever need. The spectrum display is just short of
magic. I don't want to go back.

Cecil, did you ever own or use an original GOONEY Box?

Turn the dials ... watch the green eye ... !

I don't have any meaningful tuning dials or functions on my IC-706MK IIg, IC-746 or IC-756 Pro III.

For a change of address simply go to the FCC web site, open your FRN and make the changes online in 1 minute or less depending on typing speed. Within a week the USPS will deliver an updated license for no charge.

I'm not. As a U.S. citizen, I am required to have a current U.S. license
if I am in the U.S. I am also in the only country in the world that does
not allow U.S. V.E. testing. I think they went as far as to ask the
U.S. government to not permit it.

Geoff.

>and 500 above. That's about as good an accuracy as I ever need.
>Also MicroSmith says the impedance value is j507.2 ohms.

I am surprised that Microsmith has accumulated so much error (~0.1%)
after so few operations.

I recently recieved three packages, one from the US via FEDEX GROUND,
another from the US via USPS, and another from Canada via Canada Post.
They all arrived in less than a week, and I paid no customs. There are
no customs duties for ham radio equipment.

2407. Add money to your Paypal account with OPRAH Qxo#A

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-15 22:52:43 UTC
From: NSI <af.irani@afyhpami.com>
Message-ID: <AUyEg.57510$vj1.35944@bignews5.bellsouth.net>
Source record: 54425

Read this message until the end, and you will find out how the money flows in easy !!!!.
Follow the steps and it WILL work. Trust me !!!!!.

It's NOT illegal and it is NOT a scam !!!!!.

PROVEN ON OPRAH! Reported in the Wall Street Journal!!!!

The only thing you need is : - E-MAIL ACCOUNT
- PREMIER (FREE) or BUSINESS PAYPAL ACCOUNT
- $6 on this account (The only investment)
- 30 minutes of your time

There is no limit on how much money you can recieve, and you haven't got anything to lose with this Business program. I will explain how it works !!!!!.

Follow these 4 easy steps and it WILL work !!!!!.

STEP 1 : SIGN UP FOR A FREE PAYPAL ACCOUNT !!!!!.

Paypal is a free and safe way to pay and receive money on the Internet.
Creating a account is as easy as creating a MSN account.
Copy and paste the next line in your Internet browser and sign up.
HTTP://WWW.PAYPAL.COM

Be sure to sign up for a FREE Premier or Business account and not for a Personal account. You cannot receive CREDITCARD payments with a Personal account and we can't have that. Do we !!!!!.

STEP 2 : SENT $6 TO YOUR PAYPAL ACCOUNT

This is your only investment to receive the money with ease.

With your Paypal account, send $1 to each e-mailadres listed below.
!!!!! IMPORTANT !!!!! Be sure to use this SUBJECT : *PLEASE PUT ME ON YOUR EMAIL LIST* when you send the money.

1) martine@pilote.net
2) dexxatol@netcourrier.com
3) armygirl8568@hotmail.com
4) comjii@starband.net
5) sinnek@bellsouth.net
6) nsi@nelasat.com

STEP 3 : PUT YOUR E-MAIL ADDRESS ON THE BOTTOM OF THE LIST

After you have send $1 to each e-mail address, put your e-mail address on the 6th place.
Remove e-mail address number 1, and move each e-mail address 1 step up the ladder.
!!!!! IMPORTANT !!!!! BE SURE THAT THE E-MAIL ADDRESS YOU USE IS THE SAME AS YOU USED TO SIGN UP AT PAYPAL.

Remember that this is LEGAL. You are creating a service : an e-mail servicelist.

STEP 4 : UPLOAD OR COPY THIS MESSAGE TO NEWSGROUPS, FORUMS ETC AND EMAIL IT TO ALL YOUR FRIENDS!

There are 32,000 newsgroups. Upload or copy this message to at least 200 newsgroups or forums etc, but ..... remember that the more your upload the more people will see your message and the MORE MONEY WILL FLOW IN.

How to upload to newsgroups and forums? :

After you have followed step 1,2,3 and 4, save this message (and copy so you can use it again).
Use your Internet browser and Outlook Express or another newsreader and try to find FORUMS, NEWSGROUPS,
BULLETIN BOARDS, DISCUSSION GROUPS, CHAT SITES and ONLINE COMMUNITIES. Use GOOGLE or use a NEWSERVER.
Use every option to post this message. Download PostXpert to send 1 message to more NEWSGROUPS at the
same time.

!!!!! REMEMBER !!!!! The more you post this message the more MONEY WILL FLOW IN.

Why does this Business program work so well !!!!!.

Lets asume that from the 200 (or more) messages that you have posted, only 5 people respond, you will have your
$6 back that you have invested. Those 5 people will each send at least 200 messages with your e-mailadres on
number 4. That's 6 x 6 x $1 = $36. The next 25 people will also send 200 messages with your adres on number 3. That's 36 x 6 x $1 = $216. The next 216 people also send 200 messages with your name on number 2. That's 216 x 6
x $1 = $1296!. Those 1296 people again also send 200 messages with your name on number 1. That will give us a total of 1296 x 6 x $1 = $7,776.

Now the last tier! 7776 x 6 x $1 = $46,656!!!!!!

This is only a EXAMPLE with 6 reactions. You WILL get MORE responses than that.

Remember that most newsservers will leave the posted messages on there servers for about 2 weeks. If you will post your message again, it WILL again start from the beginning. So you can repeat this over and over again.

Everyday MILLIONS of people are ONLINE and reading these messages, JUST LIKE YOU RIGHT NOW. I also was sceptical in the beginning and have read a lot of these messages. I also thought that it was bullshit.
Until I thought : What the hell!, only $6. What's $6 and a couple of minutes of my time to solve my money problems.

!!!!! REMEMBER !!!!! Follow every step, and IT WILL WORK, TRUST ME. !!!!!

!!!!! BEST WISHES AND GOOD LUCK !!!!!

w)O>+;)<9UVS;F>qaGL<Uq#v`V6(F]- rM;$g+!4IIQ*827?H4

Anyone going to visit the FCC website please leave them these ideas in
their comment box, Thanks.

1-No more automatic renewals. Individuals must retest and pass all
elements required for their license class.

2-The passing score for written exams needs to be raised to 85%.

3-Code elements should be 13 wpm for General, and 20 wpm for Extra.

4-Make the no-code license one year non-renewable.

Aphorisms are statements of truth, however brief or terse. Do you consider
truth a negative attribute?

Okay, but only if you must also retest for ALL other licenses -- drivers license, concealed firearms carry permit, plumber's license, SCUBA license, fishing license, hunting license, marriage license, realtor's license, etc.

John

Would like to hear from Owners of the XP5xx and the XP7xx series of antennas from Sommer located in Florida.

Looking at that antenna plus the SteppIR. Will go up on a 45ft Rohn Tower that now supports a TA-33 tribander by Mosley

Looking for both the positive as well as negative observations.

Appreciate your input

Ron W4LDE

There are a number of things that verify the laws of
physics. There is nothing that verifies your bogus 3 nS
delay through a 100 uH coil. You should be happy that you
were half right. The delay through a loading coil is not
nearly as large as the other side asserted.

Several years ago I had a pack and ship business. one of my customers had a VCR he wanted mailed to his son some where in Alaska. The post office used a contract air carrier to deliver the mail to the island where the son lived. As the package with the VCR was being off loaded from the seaplane it was dropped overboard. It took over a month to receive payment from the USPS (he did insure the package).

If you're into definitions, look up "sarcasm" (which an aphorism
frequently is). But an aphorism can also be an opinion, whether true
or not.

As for canada, there is a problem with tracking. At least a couple of
years ago, the cost of tracking a package, when possible, was
horrendously high. In the case of the US mail or Fedex, it was
impossible. I shipped to canada and the buyer said he didn't get it.
He sent a very impolite letter the day I noticed all other items
shipped that day arrived. I know he received it and later admitted
that it was shipped to the wrong address, which I know better.

Not being able to track makes for a risk that I was unwilling to handle at the time, so I cut out shipping to canada.

As for hawaii and alaska, tracking and shipping costs were terrible to those places as well. Some items can't be shipped by air and would be shipped by ship requiring a time delay in which, again, thieves take advantage of and get their refund.

The combination of eBay and Paypal creates a haven for thieves in those areas and others. They favor the buyer and it will ultimately cost the seller more in the long run.

APO and FPO can't be tracked either. Tracking is a requirement for the eBay/paypal so-called protection.

I was once a gi. Gi's move. Sometimes it takes a long while for the gi to receive mail that has to follow him/her.

I realize that the problems are caused by the 'few', but they create a risk or null out certain protective clauses in contracts. SOme businesses can afford to go through the extra effort, wait the extra time or live with the occasional loss. A business that loses one sale in a hundred can afford the loss better than an individual who stands to lose one in the only one or two sales they make.

Ebay/paypal is too protective for the buyers and not the sellers. The law is too difficult to motivate for most of the little sales that originate from ebay. Thieves know this and take advantage of this at every opportunity they can.

2437. Antenna Support Rope

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-16 05:22:02 UTC
From: Bruce Wilson <b.e.wilson@usa.net>
Message-ID: <KdOdnYWIjMDiNn_ZnZ2dnUVZ_q6dnZ2d@comcast.com>
Source record: 54423

I have in my yard two 60 foot steel poles about 120 feet apart, placed there 40 years ago by a previous ham owner. The old halyards, about 3/4 inch diameter cotton-covered wire (wire core was about 1/8 inch) are long gone, and I need to find new rope to haul up my wire. I can't find anything like the old stuff.

I was thinking about using wire rope, the flexible 7x19 kind, maybe stainless steel, at maybe 3/8 inch diameter. I think that will roll over the pulleys (which I think are less than 1 inch radius). Given that my longest wire will have maybe 8-10 feet of poly lines supporting each end, will wire rope present appreciably more metal at the ends than the poles themselves will?

Is there a synthetic rope up to the task? Keep in mind that the rope I need will be running vertically, and when the antenna load is placed perpendicularly, the loads on the halyard will be in the several hundred- to thousand-pound load range. Of course it needs to last for decades or more in the sun.

As always, if you have suggestions that haven't occurred to me I'll gladly listen to them.

Tsk, Klein, you don't write enough to read. It's all about
implications, inferences, and vague "truths" which don't
establish anything. Then you get pissed off when others
don't accept your "word" on things.

I will ask directly: ARE you an olde-fahrt? Or long-timer?
If so, HOW LONG?

Try not to be too vague on this. Real truth will establish
your "rep" in here. So far you don't have much of a "rep"
except we all know you are a PRO-CODER.

> "They didn't" ... "escape". Looks like the
>impostor (as far as understanding simple English) isn't me.

I can't see anyone named "They didn't" in the Google message
list, nor that of "escape."

Simply put, if you can't establish any bona fides for your
alleged long-timerness, I'll just put you in the "imposter"
list. [lots of folks from here in there...]

The tracking is not a problem, FEDEX tracking works across the borders
and the USPS and Canada Post tracking systems interface with each other
using the tracking number issued at the point of mailing.

OK John,
Well if you are sticking to the MFJ analyzer then the saran wrap will work fine as the insulator...
And scrounging up metal isn't that hard.. PCB, or aluminum from a rain gutter company, even Reynolds wrap, etc..
Yup, I thought about the thickness of the glass reducing capacity, but if you have enough jars?!? Fun to think about... Someone needs to do it and post the pics...
Check the yard sales.. Maybe you will be lucky and find an old AM radio with the dual gang 365 MMF variable caps... That will work like gangbusters... Back in the 60's I built more than one transmitter with those caps and a pair of 1625's...
Keep us posted...
cheers ... denny/k8do

> > with a 6E5 tuning indicator.

In the Gooney box the cat eye appearance was given by a properly shaped metal screen hidding the upper half of a magic eye tube (e.g. 6E5).

Well, the 6E5 is nice (I have several radios using it) but not as much as the European EM4. Similar in appearance, it has two opposite triangular dark areas (instead of just one). When tuning a station, just when one of the two triangles has got fully lit, the second triangle begins to narrow down. In a way, it is similar to a bandspread tuning system. The synchronization between the two triangles is remarkable. But I am sure there also are US-made tubes doing the same thing.

>their comment box, Thanks.

Leave them yourself. Enter your comments with dots and dashes.

>3-Code elements should be 13 wpm for General, and 20 wpm for Extra.

Thats too whimpy. Morse code = Ham Radio, right?

Make it 20wpm for general, 30wpm for Extra.

Require extras to answer 100% on ALL questions of ALL element question pools
in on ONE sitting with no multiple choice. You're not "extra" if you can't do
that.

Stop granting type acceptance to any radio that can transmit or receive on the
extra portion of the band (just like the rule for the cell phone frequencies).
Extras should be building radios, not buying them.

>4-Make the no-code license one year non-renewable.

Eliminate the no code license, wait ten years for the hobby to die, then give
2.3ghz to WiFI, 5.7 to WiMAX and auction the rest off to the highest bidder.

Looking forwards to working you on the 10ghz-and-up contest this weekend,
Glen

I've bought one of the Ramsey kits which should arrive this week.
http://www.ramseyelectronics.com/cgi-bin/commerce.exe?preadd=action&key=DDF1
I'll let you guys know how well it works when it's assembled.
Tracking to within a couple of houses is easy even without a radio that has
a signal meter but the doppler will make it all that much faster.
the serial ratbags and spastics in Sydney will get a fright when its up and
running. Unfortunately Sydney repeaters are going through one of those
phases where every sub-moron with a radio is having an obsessive compulsive
episode and we have about 20 whispering retards making the repeater
unusable. Hopefully within the next 4 weeks I can post an excel spreadsheet
with all their info. they usually piss off when they lose their anonymity.

I am using two lengths of 3/16 th black Dacron covered rope from
CableXperts, or maybe Texas Towers. It has been holding up 280 feet of 75
meter loop (#14 wire) for at least 6 years. (It makes a 90 degree bend at
75 feet). I once used 3/8 inch Poly something rope. It rotted so badly that
after 6 months I could pull it apart between my two hands. BTW, you can do a
LOT worse than plastic covered clothesline; after all, it is meant for
outdoor use.

2470. Caged Di-Pole

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-16 21:06:06 UTC
From: Joe Bloe <abaslon@comcast.net>
Message-ID: <6o17e2der3uur6acf3e21lfc3iuafo8uka@4ax.com>
Source record: 54357

Hello,
My attention has been caught by the abilities of a "Fat Conductor"
for an antenna. I understand that this has been achieved by using
what is (little known about) a Caged Di-Pole. I have seen them before
in older photographs, mostly draped over an old steamship, stem to
stern.

The Caged Di-Pole is supposed to be very well suited for weak signal
reception. I know that a Yagi can do very well in this regard, but
its the art of it that I'm interested in, and as far as I can see,
it's almost an lost aspect of HAM radio nowadays.

Does anybody remember these things?

Hi Joe..

The main advantage of cage dipole it is its wider bandwidth.
It is a nice antenna with a great "vintage" look. Apart from this, its
performance is that of a standard dipole...

Best regards

Miguel Ghezzi (LU 6ETJ)

Hi Rob,

"Supposed to be" is how fairy tales end; they start with "Once upon a
time."

>I know that a Yagi can do very well in this regard, but
>its the art of it that I'm interested in, and as far as I can see,
>it's almost an lost aspect of HAM radio nowadays.
>
> Does anybody remember these things?

More than those who can explain why, when push comes to shove. Hence
your complete introduction should have read:
Once upon a time the Caged Di-Pole was supposed to be very well
suited for weak signal reception.

The only attribute of a (uncommon) cage structure is wider bandwidth
than a (common) thin wire antenna. This is not the same as bringing
more sensitivity. The exertion of building one, and then erecting it
probably induces a wishful sense of dream fulfillment.

=====================================
Rob,

Photographs of a cage of wires slung between a ship's masts could have
been T-antennas in the good old days of LF spark transmitters. The
fat conductors increased the capacitance to ground so drawing a
greater current into the antenna.

For the electrical characteristics of a caged dipole at HF, download
program DIPCAGE2 from website below.

Yes, the only advantage of a caged dipole is a moderate increase in
bandwidth. Its resonant length is slightly less than that of a thin
wire. Its appearance has the disadvantage of upsetting residential
associations.

A few amateurs, without near neighbours, for seventy-mental reasons
still swear by it!

Reg, G4FGQ.

That would have been polypropylene, widely sold in hardware and DIY stores. It rots in no time if exposed to UV. Polyester holds up very well, and nylon is just about as good. (I think most of the rope sold specifically for antenna use is polyester.) I'd use black rope if I lived in an area having a lot of direct sunlight and/or one that's at at high elevation, since this improves its UV resistance, but ordinary nylon or polyester rope lasts many years at my western Oregon QTH. (Maybe the moss/algae growth helps.) I like nylon because its stretchiness acts as a shock absorber, but this would be a disadvantage for some applications.

==========
Dan,

The difference between loss resistance of copper and aluminium at HF is unnoticeable. It is only about half of the difference between the conductivities of the two metals which is quite small anyway. It is something to do with skin effect.

I once had a 12-feet diameter, 1.7" conductor diameter, aluminium magloop. It had belonged to a deceased blind amateur for several years. I used it successfully on the 160 and 80 meter bands.

It was in two semi-circular halves. The halves had been bent into semi-circles by machine. Aluminium is quite a ductile material. The halves had swaged ends which fitted inside each other. Easily dismantled for transportation. I never noticed any poor electrical connections.

The whole structure was lightweight. Much less than the weight had it been copper. And although it was several years old it had stood up to the English weather very well. It still looked almost new.

It was supported at the top by a vertical aluminium mast which formed a T-section in conjunction with the motor-driven tuning capacitor assembly. It was rotateable by hand through more than 90 degrees between 3 equi-spaced guy ropes. There is no interaction between a diametrical vertical mast and a circular loop.

There was a small 1/5th diameter, self-supporting coupling loop located at the bottom of the main loop and insulated from it. The coupling loop was fed via 50 feet of 75-ohm coax. No RF on the

outside of the feedline.

I never knew the sort of machine operation used to bend the
semi-circular halves from straight thin-wall aluminium tubes. It had
been done very accurately. I doubt it was extruded already bent.

It was eventually swapped to a 3rd amateur for a bottle of port wine
and may still be in use somewhere.

Reg, G4FGQ.

Polyester (Dacron) rope has the higher ultraviolet resistance. Nylon, especially if formulated with UV absorbers and anti-oxidants does fairly well too. If you get acid rain in your area, Nylon will not last nearly as long.
Polyethylene and polypropylene ropes are rapidly destroyed in sunlight.

The mechanism that protects polyester from ultraviolet in sunlight is an interesting one. When a short wavelength photon hits the polymer in the rope, its energy has to go somewhere. Often it just heats the polymer, but sometimes it breaks the polymer chain. Polyolefin ropes (polypropylene and polyethylene) have an easily broken polymer backbone. The backbone is much stronger in polyamides (Nylon). Polyesters, however, have aromatic (benzene-like) structures in them that absorb the short wavelength UV radiation and re-emit it as longer wavelength fluorescence. In polyethylene terephthalate (PET, Dacron) this fluorescence is generally in the near infrared so it is not visible. In polyethylene naphthalate (PEN), the fluorescence is in the visible region. This polyester has better barrier properties for food use and can withstand slightly higher temperatures than the PET used in most plastic soft drink bottles and food containers. But the fluorescence is unwanted in most food applications so quenching agents are added to suppress this property.

Dacron is DuPont's proprietary name for their PET. Usually rope sellers charge a premium for the name, but polyester fibers as used in ropes are manufactured by many other companies. Roy is correct about the black rope lasting longer. Carbon black added to the polyester is an excellent UV absorber.

Not that it is too relevant to your original post....

Cebik (http://www.cebik.com) talks about using multi conductor elements in wire quad design to "fatten" the conductor. He mentions that thin wire designs tend to be somewhat lossy (lower fwd gain and narrower b/w etc) and the thicker elements make up for this.

Cheers Bob VK2YQA

Barry,

There is a type of rope known here as Silver Rope. I understand that
it is manufactured from UV stabilised polyethylene and claims
resistance to sunlight. It is also claimed to be resistance to most
acids and alkalis.

It is a very low cost rope, white in colour, and is widely used in
marine applications.

I have halyards and tails of this stuff that have been in the weather
for 10 years with no significant degradation (superficially or
observed when the strands are opened up).

Silver Rope is about half the price of Dacron rope (though only about
80% of the strength of Dacron). It takes knots well (as well as the
better synthetic fibre ropes, it has a slightly greasy feel), good
abrasion resistance and it is easy to splice.

If you live anywhere near water, a boat shop might be a good source for rope
that will withstand weather and UV. Think of all the rope on a sail boat. I
haven't checked prices.

Excellent comparison. I'll abandon the wire rope idea and get some black
Dacron or polyester.

Thanks to all for your comments!

Hi John,

Sometimes the negatives, like loss, are offset by success in spite of them. For instance, using just one antenna even though your 100W translates into something far less and you can still be copied. This simply proves you can work a contact with milliwatts. A friend of mine held a long QSO from Seattle to Alaska on her dummy load, so a Beverage would have been seen as a high gain alternative.

Also, many transcievers have connections for a receiving-only antenna.
My old Kenwood TS-520S needed only a single wire change to give it this
capability. I tried a Beverage for receiving a couple of years ago.
Didn't notice much difference.

Thanks, Richard and Paul for answers about Beverage

Here's another one, if you (or anyone) wants to chime in:
There are about 4 paragraphs in the Antenna Book about Moxon design.
Again, in contrast, lots of chatter about it on the newsgroups and on
the air:
Is this a viable alternative to larger yagis and quads?

Specifically, there is an Optibeam OBW10-5. It appears to have a broad
front lobe. But, it also appears to have a lower visible profile, a
plus for the neighbors.

Is it worth consideration?

I just stumbled upon a cool approach to an "antenna-in-a-box". Titanex AKS8010 is a 3 legged tower system topped with a log period array that doubles as a capacitance hat: each of the 3 legs of the tower is a vertical.

What a cool idea.

I contacted their US Supplier: Array Solutions and Jay tells me that the producer is unreliable and not consumer-responsive. He dropped his supplier status with them 5 years ago and has asked Titanex to remove his address from their website several times.

It's listed at 2695 Euros...not cheap, eh?

Still, I think this is an intriguing approach.

Here is their (Titanex's) address:

Source record: 54441

Beverage antennas are very inefficient. This is ok for an HF receiving antenna, since lowering the efficiency reduces the signal and external noise by the same amount. The antenna aids receiving by virtue of its directivity -- signals from the favored direction are enhanced compared to QRM and noise from other directions.

You can of course transmit with an inefficient antenna. Some commercial antennas are quite inefficient, but usually have a desirable feature such as small size or wide bandwidth in exchange. The price you pay is a weaker signal at the other end of the circuit. Since people often run much more power than necessary to communicate, the loss in a Beverage or other low efficiency antenna for transmitting can frequently be tolerated. It is, of course, a poor choice if you intend to maximize your signal at the other end.

Titanex sells fine antennas. It's "first class" material. I build the DLP15:
it's a jewel.

Just one thing: the English they use in the building instructions stinks, so
you would better know what you are doing when you assemble their stuff.

They also don't know how to make pictures and the B&W photocopies (from
photocopies from photocopies) are a shame considering the cost of the
antennas.

Kind regards,

Philo

PS: I know, my English stinks too, but I don't sell antennas.

Hi John,

I'm only vaguely familiar with the design. The English seem to like elaborate wire designs with lots of crenellations. I don't recall any consistently negative or even occasional negative comments about Moxon designs. On the other hand, they seemed to asked about more than they are the subject of user's comments.

You might want to pick up a copy of "HF Antennas For All Locations," by Les Moxon, G6XN, RSGB.

>I'm not the one who misread "capacitors didn't *ESCAPE* getting color
>coded" for "capacitors didn't *GET* color coded" - YOU DID!

Nice attempt at misdirection, but a very old technique. :-)

That sort of misdirection is puerile (meaning childish).
If you have some bona fides on English grammar and some
false idea that ALL must be literal with NO departure from

such literalness, please state them. Otherwise go into
auto-fornication mode since we ain't buyin that, homie. :-)

Let's reprise. First you state that capacitors were never
color coded. You got called on that and corrected by more
than myself. Secondly, you've never admitted being wrong or
corrected. Third, you try to (badly) convince others that
those who corrected your statement are "wrong" or "at fault."

Amazing. You make mistakes and then try to convince all that
those mistakes never happened or that it is "wrong" to try to
correct your mistakes! :-)

Here's some more to chew on:

RFCs (Radio Frequency Chokes, inductors) in axial-lead plastic
tubular packages are STILL marked with color-code bands. There's
a MIL SPEC on that as all "long-time design engineers" should
know; such parts are even used in commercial market electronics.
It's really irrelevant HOW capacitors are marked as long anyone
using them can know their value and working voltage and
tolerance and apply them properly.

There are 7 (seven) amateur radio licensees in the USA that could
answer to "Al Klein." Are you one of those?

I can say without hesitation that I am NOT a licensed amateur.
I am a licensed commercial-professional in radio and have been
so for 50 years, beginning in military 24/7 big-time HF
communications 53 1/2 years ago. I have all sorts of valid
documentation on that and some in here have seen some of that.
Do you have ANYTHING in the way of ID? On the Internet?

Or, are you going to scribble meaningless misdirections in here,
attempting to portray some personal "outrage" for being
corrected? Especially about a well-known electronic component
identification method which you don't seem to know yet others
can verify?

I'll just put you down as an IMPOSTER poster, one of those
wanna-bees who might never have been anything but really,
really wants to be someone. That's up to you. I don't care.
I've seen your kind on the Internet, on the Bulletin Board
Systems since 1984. None have anything worthwhile to
contribute but all wanting to be a SOMEBODY on screens.

Mark, Just ignore them.

They only tease you because of the stupid things you say when you
follow up. Just ignore them and they'll give up.

Stop giving them reasons to tease you. It only makes you look
more stupid.

Take a break from the radio groups for a while, Maybe work on your
moon bounce some more.

Gee. . . You're sure a cheery fellow.
I was mostly interested in the Historic Art of the darn thing. I well know it's majorly "Out Dated", but if one does things for the pure enjoyment of it, then I guess it's not the issue of performance, but art, which is also defined by retrieving a wonderful time from out of our past. I'm just a stupid romantic at heat. . . And I enjoy being so.
Thanks for the info though. I guess some how I got the information backwards, but then again, I also see a great many views on the subject of a fat conductor. . . Me thinks the subject still isn't closed due to that simple fact that nobody really yet knows for sure.

Ironically, polypropylene rope, the very worst kind for UV, is often sold as water ski tow rope and for other marine applications, because it floats. So check the label carefully.

A friend of mine once built an 80 meter vertical from PVC pipe, with a wire inside or outside of it. Being an analytical sort of person, he carefully calculated the wind loading, allowing for the 100+ MPH winds not uncommon in his area of Colorado. Then he selected guy rope of the required strength, with a hefty safety margin. It worked fine for about 6 months, then the antenna fell over on a day when there was only a slight breeze. Mystified, he inspected the antenna and found that he could pull the rope apart with his bare hands. That was when he, and I, learned about polypropylene rope and sunlight. Of course, his location at about a mile elevation and where the sky is clear 300 or so days per year was a particularly harsh environment for plastic as well as for fair-skinned people. I got away with using the stuff for a couple of years here in western Oregon. But there are a lot better choices.

The ARRL Antenna modeling course includes the Moxon.
I kind of visualize the elements to be analogous to top hat tuned
parts of a two element Yagi.

I did not receive any Moxon examples in my copy of EZNEC but I am
confident it would model it OK.

I don't recall the feed details.

You can probably arrive at the same correct technical
conclusions by downloading the free demo version of
EZNEC and selecting the diameter of the conductor.

No doubt, Cecil. Of course this wasn't where the conversation started at. I haven't tried EZNEC to model a cage antenna, will it do it? Or do you just make the wires really thick? And how does really thick wire compare to a cage of the same relative diameter?

Hi Mike,

Close, but no cigar. Actually, the degree of closeness depends on how
well the cage represents the solid. That degree is a function of the
number of wires that form the skeletal shape. Four is pretty lousy,
120 would be outstanding. Then there is something in the middle:

http://home.comcast.net/~kb7qhc/antennas/verticals/Cage/cage.htm
offers an example that may be suitable. This is a 4 meter tall
antenna that tunes all frequencies from 20M through 10M.

Hi Rob,

One does not have to be:
1. Stupid;
2. Romantic;
or
3. Out Dated
to use a cage properly.

> Me thinks the subject still isn't
>closed due to that simple fact that nobody really yet knows for sure.

Visit:
http://home.comcast.net/~kb7qhc/antennas/verticals/Cage/cage.htm
to see just how much work you have to go to (the picture explains that
easily enough), to know for sure (it isn't really all that
mysterious), and to get it right (not hard in the least).

Speaking of someone who truly knows what he is talking
about Roy, here's a technical question for you.

Given that a mobile antenna stinger has a VF of
approximately 1.0 so we can determine the approximate
number of degrees that it occupies and ...

Given that we can use EZNEC to determine the feedpoint
impedance of that stinger, it seems to follow that ...

We should be able to use a Smith Chart to determine
the characteristic impedance (Z0) of that stinger.

Yes, no?

You can use the free demo version to model a large diameter
radiator with up to 20 segments. For the actual multi-wire
cage antenna, one would need to spring for the non-free
version which is, IMO, the best bargain in ham radio
antenna simulation software. Why ask questions here when
the answer is available to any individual who springs for
EZNEC?

Like Roy says... good luck... Better be some really UV
resistant stuff if you want it to last decades.
>
> As always, if you have suggestions that haven't occurred to me I'll gladly
> listen to them.

Myself, I use antenna support *wire*. And that will last for decades.
But another reason I do that, is often I lengthen the antenna wires
for other bands. Fer instance, at the moment I'm using an 80 meter
turnstile, which are crossed dipoles, and also a 40 meter dipole,
all fed parallel with one coax. But two of the 80m wires can be
doubled to act as a 160m dipole, and also I have a set of jumpers
to use it for 20m. So by just changing the locations of the
insulators,
I can change things around according to season. I can have the present

setup, or I can have 80,40,20, or I can have 160,80,40. The latter is
the usual "winter" mode. My wires including the support wires are
so strong they will crumple the top section of mast before the
wire breaks. I had that happen when a large tree branch fell on a
leg in an ice storm. The wire didn't break. But it bent the top mast
section over, and I had to replace it. That was cheap though, as
I use an extra top mast section which is not part of the actual
telescoping mast. Sure, fresh rope is just as good, but it won't last
as long as the wire. Mine is insulated also, so that helps to prevent

corrosion. I don't see why it wouldn't work in a pully as long as it
didn't kink up on you.

> >Maybe better to get two bands that work than five that don't.

The butternut will blow the doors off the hustler on 80 and 40.
The hustler verticals use the same lossy traps that the mobile
whips use. I think the resonators are exactly the same unless
they have changed them. I don't like their coils. They are overly
lossy for my tastes. Comparing my cheap homebrew coil directly
against the hustler coil is a large difference in performance.
I think of them as dummy loads on a stick, but to each his own
I guess. I have some of those resonators laying around here I get
free. I won't use em... No way... They collect dust. I guess I
should give them away to someone else...
For 5-6 etc bands, the HF6V is quite a bit more efficient than the
hustler. Not a big deal on the higher bands so much, but the
low bands will separate the sticked heater loads vs the radiators
of RF... :/ OF course , both of those needs either radials on the
ground, or tuned radials if elevated. The "1/2" wave type R7's. etc
might well be a pretty good option. I've worked quite a few of
those, and used one at field day, and they work pretty well.
Not as good as a HF2V on 80m, but maybe close on 40m..
Just depends on the setup. It is handy not requiring radials
to function..

Ultraviolet stabilizers can only do so much for polyolefin plastics. But these plastics do resist acids and other chemicals very well. I suspect this rope material contains a significant amount of titanium dioxide pigment. Unlike carbon black which absorbs the ultraviolet, the titania reflects it. What normally happens with polyolefins containing significant amounts of titanium dioxide is that the surface degrades quickly leaving a layer of the exposed pigment to reflect most of the ultraviolet, thereby protecting the polymer underneath. In some cases, the oxidized surface will hold moisture and conductive salts slightly reducing its insulating and dielectric properties.

One reason polyester ropes stretch so very little has to do with how the fibers in the rope are made. After the fiber filaments are extruded, they are immediately stretched. This axially orients the polymer chain and gives it a much higher strength. The same thing is done when making soft drink bottles out of polyester. They start with what is known as a parison (or preform) which is injection molded. This preform has the screw top

molded in. The bottom of the parison is heated in an infrared oven above the polyester's glass transition temperature (around 90 to 95 C for polyethylene terephthalate). It is then placed in a mold and inflated to create the bottle shape, This inflation does bi-axial stretching of the polymer backbone giving the bottle its great strength.

If you want to perform a simple experiment, take a PET bottle and hold its neck or cap area with a pair of long pliers. Carefully pour boiling water (100 C) into the bottle. This is above the plastic's glass transition temperature. The bottle will shrink, much like heat-shrink tubing, but it will not completely return to its original size. If you do this experiment, be VERY careful as boiling water will spill out the top of the bottle as the bottle shrinks.

I used to work in the research laboratories of Eastman Chemical Company. Eastman made PET, PEN, PETG (glycol-modified PET, used in microwave/conventional oven dinners), as well as polyethylene and polypropylene. Some of their liquid crystal polymers would make excellent, very high-strength rope, but the cost would be rather prohibitive for most hams. I still have a large bag of fiberglass filled PET tensile test bars from my days there. These make wonderful antenna and open-wire line insulators.

Dacron was originally PET fiber made by DuPont. It was their registered trade name, but.is now owned by Invista. When Eastman Chemical Company was still part of Kodak and still manufactured PET fibers, its trade name was Kodel. Polyester fibers are made by a number of companies, each with their own tradename. When referenced as rope, polyethylene terephthalate is usually implied. However, other thermo-softening polyesters, such as polybutylene terephthalate end polyethylene nalhthalate, are available. Thermo-setting polyester resins, too, are found. These are commonly used in fiberglass boats and some printed circuit boards although most printed circuits use epoxy resins.

Quoting from the Invista website(www.invista.com):
"INVISTA is independently managed but wholly owned by a subsidiary of Koch Industries, Inc. On April 30, 2004, subsidiaries of Koch Industries, Inc. acquired INVISTA from E. I. du Pont de Nemours and Company. INVISTA, formerly DuPont Textiles and Interiors (DTI), was merged with KoSa, a producer of commodity and specialty polyester fibers, polymers and intermediates. KoSa had been a Koch affiliate since 1998."

Tam's totaly correct in that. I tried it, only to find that a three elemnt yagi performs a whole lot less than a silly J-Pole does on 2 meters. That, and your modulation drops out the bottom for some reason too. 5 elements or more. Fewer elements is just a wast of your time, effort, and money.
Also, a cheap TeeVee rotor will work very well on such a small yagi like that!

A single fat wire can be a reasonable approximation to a cage provided that the diameter is very small compared to a wavelength. (The NEC recommendation is around 0.02 wavelength maximum diameter, which you can find in the EZNEC manual in the Building The Model/Modeling The Antenna Structure/About Wires topic.) For a cage of only a few parallel wires, you can use an equivalent diameter as follows, where d = the wire diameter and s = ctr-ctr wire spacing, everything in the same units:

2 wires - Equiv. dia. = 1.414 * sqrt(d * s)
3 wires in a triangle - Equiv. dia. = 1.587 * cube root(d * s^2)
4 wires in a square - Equiv. dia. = 1.834 * fourth root(d * s^3)
N wires equally spaced on a circle with radius r -
Equiv. dia. = 2 * r * Nth root((N * d) / (2 * r))

-- derived from equations in Fundamentals of Coupled Lines and Multiwire Antennas, by Hidenari Uchida (Sasaki, 1967).

I've made myself a note to include this in a future EZNEC manual update.

For cages larger than about 0.02 wavelength diameter, you should model the individual wires.

Roy Lewallen, W7EL

2542. VHF/UHF antenna on a motorcycle

Newsgroup: rec.radio.amateur.antenna

Hello all ,

I would like to install a VHF-UHF antenna on my motorcycle . It's a Suzuki GSX750 . I did some tests with a Diamond NR-770H and it works well . The only problem is that the antenna is to big for such a bike .
Afterwards i did a test with a Diamond NR-77 . The antenna is about 43 cm and that's about the size i would like to use .
The problem i have with this antenna is the swr , it's to high .

Anyone an idea how i can solve this problem ?

Many thanks .

Tom

Andy suggests:
Well, if it were me, I think it would look really cool on top
of my helmet.
As an alternative, you could mount a couple of Viking horns
on either side of the helmet, and use them as a dipole....
Use Texas longhorns if you want to go to HF......
Lots of fashion possibilities..

Good luck, Andy W4OAH

I looked it up in my course materials. It has a balanced feed of 50 ohms. A very broad front lobe with a high front to back ratio. I believe you could consider it on par with a compact (short elements) 2 element Yagi. Structurally, I think the "tails" are a bit of a problem compared to other forms of shortening.

It is difficult to compare Quads to anything else.
Quads always look good on paper because they are essentially a pair of antennas that are efficiently coupled. They are challenging to build, install & maintain due to the three dimensional construction.

I have not built one (yet?)...

Paul,

The reason is very straightforward. This is a boatanchor newsgroup
and it's mostly geezers who deal in old radios.

Geezers live in the past; WE don't think critically; the same tired
thoughts cycle through our heads. Even worse, many of us
hallucinate and make up reasons. You'll see several in this
thread.

Many geezers (to be fair, not all) are Xeno-phobic.

To them, Hawai'i is FAR away and never having been there, geezers imagine that it's a foreign country with different laws a strange language. In their minds, it's a not that far from Hawai'i to, say, Nigeria or Pakistan. Even if they could call the Honolulu police to report a deal gone bad, they would not be able to speak to them with finding a translater.

On the other hand, a geezer thinks, OK, I'm in Virginia, if a $30 deal in Kansas goes bad, I'll just get in the Biscayne and drive over there tomorrow, demand my money. I have that recourse.

People! As Paul says, Hawaii and Alaska are U.S. States.
They have senators in Washington. They vote for the president. As far as the U.S.P.S, FedEx, and UPS are concerned, those states are, like, right over there.

To Sprint and other fone companies, after 7 or 8 PM, just pick up your fone and those places are a free call. If you pay for wired service, it's 5 or 7 cents a minute.

Here are some actual numbers from www.fedex.com

2 day service - 20 pounds

Virginia to Kansas - $61.85
Virginia to California -$65.83
Virginia to Hawai'i - $66.87

2 day service - 60 pounds

Virginia to Kansas - $151.93
Virginia to California -$166.63
Virginia to Hawai'i - $169.24

About the same price for 2nd day service.

FedEx Ground service - 20 pounds

Virginia to Kansas - $12.70 - 4 days
Virginia to California -$16.03 - 4 days
Virginia to Hawai'i - $48.22 - 7 days

FedEx Ground service - 60 pounds

Virginia to Kansas - $28.40 - 4 days
Virginia to California -$39.08 - 4 days
Virginia to Hawai'i - $114.63 - 7 days

Three days longer and more dollars going ground to Hawai'i. But then Buyer Pays Shipping!

The same tracking and return receipt, the same laws govern the business deal. It takes about the same amount of time.

The reason that they say "lower 48" is that they think it's still 1936. It just comes out. There's no reason other than old

thoughts cycling in old heads like regeneration in a triode.

It's like hollarin' out,

Kids these days!

You call that music!

Dag-nabbit!

I've bought items from Canada and sold to Canada. One thing I don't like about it is that it's expensive to ship across the border. In fact, it's cheaper to ship though Canada to Alaska.

But then, buyer pays.

I just had the experience of buying from China, a DEGEN DE1103. If you don't have one, go over to the Bay and look up the seller LIYPN. $44 for the radio and $24 shipping and insurance. Took about 8 days to get here.

This is the best pocket shortware radio. Check out the reviews on the web. 1 kHz readout, better than 1 uV sensitivity, stable, 4 and 6 kHz filters. Covers 100 kHz to 30 mHz continuous so you can listen to AM broadcast, 160 meters, everything!

I can sit in my car, pull out the whip antenna and copy 7040 CW in the evening. I heard W1AW CW the other day, this is in Virginia.

SSB sounds good. Well, mostly good. I still can't understand the hollarin' on 27,000.

While you're buying and enjoying the DEGEN, think about global commerce and the fact that you just traded with a real foreign country.

You may not be getting a proper counter-poise to the antenna system.

I would check grounding on the antenna and make certain the antenna
mount is in good solid contact with the metal frame of the bike.

You mentioned the larger antenna worked well. Does that mean the SWR
was good or it just performed adequately?

Which band is having the SWR problems?

What type of mount does the Diamond use? I am very partial to the NMO
type antenna mount. I know there are some antennas that use an SO239
type mount which is just a "UHF" connector on the end of a piece of
coax. These are not that well suited for 70cm operation although you do
see them quite a bit.

Also, how much power are you going to be putting into the antenna? I
would be concerned about RF exposure if its very much.

Andy

No doubt, it is great software.

> Why ask questions here when
> the answer is available to any individual who springs for
> EZNEC?

First thing is that Mr Bloe didn't start the thread off as what the bandwidth of a cage dipole was. The bandwidth question came later. So while it is good advice to send someone to EZNEC, it is kind of presuming the person already knows the answer to their question when you expect them to *not ask the question* in the first place.

I find the topic interesting, and certainly the feedback I've gotten from Richard and Roy have been very illuminating. So I encourage more on the topic.

Sure beats those 2000 post threads we seem to get in here! I'd sooner see topics such as this than you and W8JI sharpening your claws on each other......hehe

>I'm sorry, I know what MARS is...what is MURS?

MURS (Multi-User Radio Service) is an unlicensed service using the 5 frequences 151.820, 151.880, 151.940, 154.570, 154.600 MHz. The FCC permits a maximum of 2 watts (TPO) on these channels but allows the attachment an arbitrary gain antenna (with height restrictions). Since repeaters are not allowed, you can think of it as something akin to 2 meter simplex. As a result, I feel that this is a much more serious unlicensed service compared to FRS.

It is my experience that the upper 2 frequencies are used mainly by businesses (Costco, Walmart, etc) and the lower 3 are pretty much dead. For this reason, the antennas that I have constructed are geared more for the lower 3 frequencies.

See <http://www.provide.net/~prsg/murs_faq.htm> for more information.

My 6m antenna is a Moxon. I built it because it seemed to be a good tradeoff over a 2 element yagi, I hear the gain is within a dB or so of a typical 2 el yagi but the front-to-back is very much more (for a relatively broad-banded design); the element tips are bent in to enhance the coupling between the elements and ensure a proper phase relationship to get good front-to-back.

Mine is very small and light, modeled F/R around 50-50.5 is >25dB or so, real F/B is s7/inaudible on my FT-857D, for what it's worth. (Not much, I know. I've moved out of the apartment and into a house with a backyard so maybe I can make some non S-meter based measurements). I think it's worth considering vs. a 2 element yagi for HF. You'll notice the enhanced directivity more than you notice ~1dB of gain.

On 6m, I was just looking for a very small, light array for an apartment balcony antenna, and I liked how the Moxon stacked up. I didn't really think the F/B was really going to matter until a security light went on the fritz during a nice opening... the band was open out west to Idaho, California, etc. The light was to my east. Pointing at it; s9 noise, pointing away with the light in one of the back nulls, nice band opening, no noise! Since it has a broad forward beam, beaming off 10 degrees to get one of the -35dB nulls in the back on the noise source didn't affect the desired signals much.

OK, so, dumb "I worked this cool stuff with it" anecdote aside, mine does what it claims to, and I think it's worth considering, especially for the lowest band on a compact multiband array. It makes it more compact and increases the F/B ratio over a 2 element yagi. The extra directivity makes it work very well as a beam psychologically and emotionally, and there is a even a modest actual improvement to signal to noise, moreso if you have a real noise problem in some direction and like beaming the other! At the apartment, when that light wasn't acting up, beaming to Europe put my building and the other closest buildings off the back... there was a substantial reduction in the noise floor when I was pointed that way...

I'm considering one for 20m now. I have permission to put up some antennas at the new rental house but I don't have a ton of space. You can make one with fiberglass fishing poles and wire that's quite light and can be rotated with a TV rotator, though I wouldn't trust it to survive a major gale. www.moxonantennaproject.com has a bunch of pictures and descriptions. Mine is at www.n3ox.net/projects/sixmoxon.

NINE elements for 160!?!

Any pictures online? Is this a rotatable rigid monster?

BTW, the log periodic on top of the tower sounds like a cool setup, I'd rather roll my own antennas, but it was clever to market it as an all-in-one solution. It's the very high end G5RV :-)

Hi Mike,

Going further, as you encouraged, you can observe the caged concept
applied to the Discone antenna at:
http://www.qsl.net/kb7qhc/antenna/Discone/discone.htm

This also shows how well 16 wires approximate a solid, and further, it
also shows how the geometry of the apex angle affects the matching
characteristics. This is shown in 7 Smith charts where that angle
varies from 20ï¿½ to 90ï¿½.

Upon close examination, it appears I report the wrong interval of
frequency sweep as every 0.5 MHz. Certainly the range covers 1 to 30
MHz for them all, but it would appear that I shift to every 0.25 MHz
for 50ï¿½ through 90ï¿½.

Since it appears that the benefit of the cage is bandwidth I ran a few
scenario's with EZNEC and a 40 Meter vertical that is 33 feet tall.
note that I did not correct for resonance shifting and that I am
assuming that whatever the mesh is, it will not beat a solid.

http://www.dixienc.us/28FtVert/BandwithVsDia.htm

Given that most of us agree that trying to better a 2:1 SWR is into
diminishing returns I believe this illustrates the cage's loss of
popularity.

Defiantly an appealing sight though...

It takes a month of Sundays for an expert to enter and interpret the
input/output data of a cage dipole using an Eznec-type program.

The basic characteristics of a cage dipole can be displayed, in
practical terms, in a few seconds by downloading program DIPCAGE2 from
website below.

Vary length and diameter, number and gauge of wires in cage, etc., and
observe how resonant length, bandwidth and SWR change.

Program DIPCAGE2. Its about 1/2-way down the list. Been there for
years!

I agree Bob, and maybe we'd have better operators as a result. Considering the waning interest in our dying hobby though, all that would probably do is eliminate even more operators from the ranks, leading the FCC to reduce our bands even more by selling them to the highest bidder.

Ham radio was so much better back in the late 70's, when I first became licensed. People were polite, and the radio had a mystique to it. With the internet and the immediate gratification that everyone seems to expect these days, Ham Radio is undesirable; having to hunt for contacts when you can just IM someone? Having to work for a license? Not anymore, no one wants to put any effort into anything when they have an easier alternative. Unfortunately, the good old days are gone, and ham radio is in the sunset of its existence.

There was something wrong with that yagi then... Seriously..

That, and your modulation drops out the bottom for some reason
> too. 5 elements or more. Fewer elements is just a wast of your time,
> effort, and money.

A 3 el NBS yagi gives appx 9.4 dbi gain. How is that a waste of time
effort or money? The difference between a good 3 el, and a good 5 el
are not all that large. I have a 3 el yagi for FM mounted vertical. I
hear
stuff on that thing that doesn't exist on a vertical.
This is not to say more elements are not worth the trouble. They
usually
are. But if you have a 3 el that gets smoked by a lousy J-pole,
Houston , we have a problem.

It is a viable antenna, and not outdated. It might help you eke out a bit more bandwidth on 80/75 meters. And as far as I am concerned, it is plenty cool looking too.

Okay, so you are a romantic. I have a little bit of that in me too! Try these on for size:

Make and use some real open line feeder. This stuff is cool, works really well, and has a real retro look to boot. Most of the time we use plastic spacers these days, but if you want to be authentic, you could use wood dowels soaked in hot paraffin.

Of course you'll need a tuner for that setup. How about an "open faced tuner"? Wind the coil on a suitable form, and use clips to attach to it to tune. Make everything pretty, and you'll have a nice nostalgia type station that also works. I'd suggest that the tuner have a plexiglass cover for safety.

Old school, You bet. Very very cool though.

Just a word of caution:

Years ago, when the Brussels police had VHF radios mounted on BMW bikes for the first time, the ABS brakes stopped functioning when the transmitter was on (Not only the ABS, the brakes).

I suppose ABS brakes are more EMC proof nowadays, but you can not be too sure.

What is to "misunderstand?" Brian Burke wrote in that fashion,
perhaps too colloquially for your absolutely-literal standards
of English, but it was perfectly clear to most readers here.

>Then you tried to weasel out of
>looking like the ass you are by looking even more stupid.

Trying to insult those who challenge your "knowledge" of
electronic components isn't going to win you any points.

The FACT is that capacitors and axial-lead inductors have
been color-coded for decades. That can be verified by looking
at component manufacturers' catalogs and several textbooks
(even going back to the ITT "Green Bible" of the 50s) as well
as the ARRL Handbooks (several years worth).

You call that "stupid?"

I wouldn't. Any self-respecting worker who has been in
electronics for years wouldn't.

Had you wanted to be "civil" about it, you could have simply
acknowledged your mistake, stopped trying to build a Mt. Everest
out of a teaspoon of sand, and gone on with life. You did not.
You have MANUFACTURED a dispute, insulted your challengers, and
implied a number of things, all without any referencible data.

Your definition of "stupidity" seems to be that of ANYONE WHO
DISAGREES WITH YOU or one who DOES NOT HONOR AND BOW-DOWN TO
YOUR SUPPOSED MAJESTY AS AN AMATEUR.

Unfortunately, those "definitions" seem endemic to pro-coders,
those who insist on keeping a morse code test for amateur radio
into the far future. That viewpoint is entirely EMOTIONAL
based on your own experiences, has no validity in the supposed

"necessity" of keeping that morse code test in USA amateur radio licensing.

"You did it so everyone else has to..."

That's a selfish, self-righteous viewpoint in my opinion.

It confuses the actual necessities of a government regulating agency trying to mitigate many, many users of the civil radio spectrum with some fraternal-organization in-house "rules" of just one radio service out of many, "rules" that were established decades ago.

You cannot support your "cause" with anything but throwing personal insults at your challengers. You have already LOST your arguments concerning the morse code test issue. You win NOTHING except in your imagination.

It is even worse, perhaps sociopathic in that over-the-top self-righteousness, to claim you are a "better human being" just for having taken a morse code test...as an AMATEUR. You seem to look down your royal nose at all who wish to remove the code test from amateur radio licensing. Especially so when you cannot establish your bona fides of "long-term experience" supposedly in radio beyond amateur activities.

>You're not worth my time.

Obviously not, "your majesty." :-)

Here's a suggestion: Drop the "outraged" act and start thinking about the SUBJECT, not your own emotionalism. One good way to make you feel better to yourself is to find a morsemanship-support group. Such a group can sit around and praise one another. Makes all in the group warm and fuzzy holding the same opinion. Its also a way to hold off the future and any changes in regulations, but only within your own fantasies.

An alternative is to just LEAVE rec.radio.amateur.policy. Few in here see you as the Final Arbiter of what is "good" and what is "bad" in amateurism.

Leave or stay. Your choice. Matters not to me. Government will continue - in a democratic-process fashion - to serve ALL citizens, not just one group of radio spectrum users. A group, I might add, that is a distinct MINORITY of all radio users.

Think on that. [few pro-coders do]

It's a "sort-of" reminder, Mark, but let's clear up something:
I don't personally "loathe" this "exmarine." That person
isn't worth much in here, always insulting those who just
disagree with his viewpoint. It's not possible to have any
sort of dialogue with Major Dud. :-)

It's pretty much the same with all the self-righteous, ultra-
conservative (about the code test) pro-coders. Sigh.

As to Klein, all he seems to want in here is to FIGHT. In
that regard he is a clone of Robeson and first cousin to
several others in here. He is too haughty to correspond
with anyone who disagrees with him.

Perhaps someone once jammed an IC above his arm?
He has been going around "with a chip on his 'shoulder'"
ever since... :-)

2574. 9 m Monopole Analysis

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-18 20:17:48 UTC
From: Frank's <frank599@nospam.telus.net>
Message-ID: <MfpFg.10215$Nz6.3135@edtnps82>
Source record: 54310

Reg:

Here is the results of my analysis of a 99 radial monople:
Height 9 m, radial length from 0.5 to 10m, all conductors
#14 AWG copper, ground Er = 16, resistivity 150 ohm - m.
Radials 25 mm below ground. Antenna efficiency includes
the surface wave.

Radial Length (m)	Radial Z (ohms)	Radiation Resistance (ohms)	Ant Efficiency (%)
0.5	63.0 - j 33.6	13.2	17.6
1.0	47.7 - j 18.2	13.2	21.7
1.5	41.8 - j 13.7	13.2	24.1
2.0	38.3 - j 12.5	13.2	25.7
2.5	35.7 - j 11.2	13.2	27.1
3.0	33.4 - j 10.8	13.2	28.3
3.5	31.6 - j 10.5	13.1	29.4
4.0	29.8 - j 10.1	13.1	30.6
4.5	28.2 - j 9.5	13.1	31.7
5.0	26.8 - j 8.9	13.1	32.8
5.5	25.7 - j 8.2	13.1	33.8
6.0	24.7 - j 8.0	13.2	34.7
6.5	23.9 - j 6.9	13.2	35.6
7.0	23.2 - j 6.2	13.3	36.4
7.5	22.6 - j 5.5	13.4	37.7
8.0	22.1 - j 4.8	13.5	38.0
8.5	21.6 - j 4.2	13.7	38.8
9.0	21.2 - j 3.5	13.8	39.5
9.5	20.9 - j 2.9	14.0	40.2
10.0	20.7 - j 2.2	14.2	40.9

Note that the radiation resistance is computed
from the total radiated power (including surface
wave) divided by the RMS base current squared.

The radial input impedance is derived from
the difference between the antenna input
impedance and the radiation resistance. A
fraction of an ohm can be attributed to the
copper losses in the monopole. Also
some of the imaginary part of the radial impedance
must be due, in part, to the input impedance
of the vertical section.

With 0.5 m radials the surface wave accounts for
2% of the total radiated power. With 10 m radials
the surface wave accounts for 5% of the TRP.

Frank

Fascinating, and thank you! The discone and the Smith charts for it are
a great graphic tool. I note that your webpage is also featured in
Wikipedia.

Hi Tom,

You might want to try an HT antenna, such as the RH77CA - about 38 CM
long.

I'm curious: How did you calculate the total radiated power including surface wave, and how did you determine what fraction of the radiated power is in the surface wave?

From: Pin-medic on Fri, Aug 18 2006 10:30 am

>I agree Bob, and maybe we'd have better operators as a result. Considering
>the waning interest in our dying hobby though, all that would probably do is
>eliminate even more operators from the ranks, leading the FCC to reduce our
>bands even more by selling them to the highest bidder.

1. The FCC has NOT "reduced 'your' bands," nor is it somehow
threatening to "sell them" to anyone. Had you bothered to
look at this process of AUCTIONING certain COMMERCIAL bands
and the Congressional laws establishing it, you would have
seen that it does NOT apply to radio amateurs.

2. Since WARC-79 'you' have gotten MORE BANDS and that has
increased up to a few years ago when 'you' got the five
60m channels.

3. There doesn't seem to be any "waning interest" in USA
amateur radio considering the overall licensee numbers.
The newcomer licensees are - just managing - to keep the
licensee numbers in numeric bouyancy, almost keeping pace
with those letting their licenses lapse. See www.hamdata.
com FCC data page.

4. "Dying hobby" must be entirely subjective since there is
no real sign that amateur radio equipment and supplies
companies are closing down nor has the ARRL threatened to
dissolve their $15M per annum profit publishing business.
Since 1990 three INDEPENDENT amateur radio publications
have ceased, primarily due to lack of advertising revenue,
NOT for interest in the hobby.

>Ham radio was so much better back in the late 70's, when I first became
>licensed. People were polite, and the radio had a mystique to it.

I find that highly subjective, primarily in comparison to the
times of the mid-50s. Let's look at the "mystique" of the
late 1970s insofar as radio communications are concerned:

1. Communications satellites were well-established for
international video-audio relay with thousands of
circuits for voice and data. More would come in the
next three decades until the geosynchronous orbit
positions were filled before the 1990s were over.

2. HF spectrum users, the majority being commercial-government prior to the 1970s, were LEAVING HF for more reliable 24/7 circuit throughput IN the beginning of the 1970s. The peak use of HF occurred during the mid-1950s to 1960.

3. Tens of thousands of radio communications licensees (with all their users and equipment) were ALREADY up and communicating from low-VHF on up. That would continue to grow in the next three decades until the FCC and NTIA had to expand the VHF-and-up spectrum for such radio services as PLMRS (Private Land Mobile Radio Services), maritime radio (for private boat owners and inland-waterway and harbor comms).

4. MILLIONS of Citizen Band radios existed, CB (on HF) was created in 1958, two decades before the late-1970s. Licensing of CB had been dropped and the off-shore radio makers had established themselves in the radio market, including CB.

5. "Radio" was KNOWN to the general public as a means to communicate and had been known for decades. "Known" in a sense beyond the obvious of TV and AM and FM broadcasting and international telecasts. The public did NOT "know" that morse code modes were used except perhaps for watching the last of the "Westerns" on TV and old WW2 movies.

6. In the mid-1950s the BIG communicators on HF were already in a process of change of mode. Teleprinter data was the overwhelming majority mode for written communications for commercial and government users of the ONLY long-haul comm circuits. Microwave radio relay for both short and long distances on land had already begun. Only the maritime world held to their morse code modes with, rarely, voice on AM.

7. In the late 1970s 'you' already had solid-state HF radios (transmitters barely reaching 100 W PEP) with the beginnings of synthesized frequencies. VFOs, now reliable and stable, were a standard feature for frequency control. In the mid-1950s frequency control of the then-standard tube type radios was essentially one-crystal/one-frequency type unless one could afford a very expensive (then) "Collins" (or equivalent) manufactured radio.

8. The Semiconductor Era had already begun in ALL of electronics and new techniques and methods were the order of the day in comparison to the limitations of tube architecture in the mid-1950s. In that regard, there IS a "mystique."

I would state that a vast cornucopia of things were
suddenly opened by the many-plateau advances in
electronics technology, sometimes happening at a
rate of advancement that was near overwhelming.
Having been a part of the electronics industry for
53 years I not only saw it but was immersed in it,
doing it while keeping up with it.

>With the
>internet and the immediate gratification that everyone seems to expect these
>days, Ham Radio is undesirable; having to hunt for contacts when you can
>just IM someone? Having to work for a license? Not anymore, no one wants to
>put any effort into anything when they have an easier alternative.

Unless there has been some "stealth" action of government
to redefine FCC rules, amateur radio has ALWAYS been considered
a non-commercial AVOCATION. It is a HOBBY without having to be
stated as such in Parts 1 and 97 of Title 47 C.F.R. There is NO
legal necessity to "WORK" for a hobby pursuit, is there?

Absolutely YES, I will opt for an "easier alternative" to
ANYTHING! When I began in Big-Time HF radio communications,
the "easier alternative" ALREADY existed in the products of
Teletype Corporation. The teleprinter had already displaced
manual morse code modes for the majority of messaging even
before WW2 (in business and government and the military).

So, if 'we' all do this 'work' thing, who is going to
give 'us' this permission to exist on the same planet as
all you extras? Would 'we' be FIRED if 'we' didn't
'work?" [delusions of Donald Trump there?]

Ah..."not enough EFFORT being put forth" by us not-licensed-
in-the-AMATEUR-radio-service? Right...some of us have been
professionals in radio and electronics for decades, WITHOUT
any morsemanship tests! Even though we've put our own time
into keeping up with radio and electronics for all those
decades (without renumeration for those efforts), that isn't
good enough for you? Here, have a [rude Italian hand gesture]

The FCC was NEVER chartered as an academic institution and
those valued [suitable for framing] licenses are NOT "grades
earned" (after all that 'work'). The job of the FCC is just
regulate, mitigate ALL civil radio in the USA. Mere 'tenure'
as a radio amateur does NOT make someone better nor does all
the snarling about "nobody wants to 'work' for their license"
change anything. You want the US amateur radio regulations
to FREEZE in those old days ways? Fine, send in your
proposal to the FCC and tell them why it should remain in
the freezer. They MUST, by law, examine ALL proposals
submitted by citizens. [I wouldn't expect that they actually
put forth an NPRM on keeping regs on ice, but they WILL
look at it]

>Unfortunately, the good old days are gone, and ham radio is in the sunset of
>its existence.

1. Take your sunglasses off or step out from behind the
curtains. It is a BRIGHT day with sun HIGH in the sky
for amateur radio...unless you are one of the olde-
tymers who refuse to acknowledge change.

2. There exist new medications that can alleviate depression
and, perhaps, a feeling of ennui. See your doctor about
that.

3. "The good old days are gone?" THANK GOD! I was IN those
'good old days' and am damn glad that radio and electronics
has improved, gotten easier, enabled us (except morsemen)
to do more and better things! I look FORWARD to each and
every improvement that makes things EASIER! I've already
done lots of things with lots of personal labor and I
sincerely APPRECIATE whatever labor-saving, work-saving
things that are available now.

Hey, if you WORK real hard, study real hard, maybe you can
come up with a TIME MACHINE! Yeah, right, it could take you
back to those "good old days" that you seem to like so much.
Like back to a time when "ham" was a pejorative expressed by
professional morsemen? :-)

2579. Re: Caged Di-Pole

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-18 23:08:29 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <12eci3hqcduoac7@corp.supernews.com>
Source record: 54315

This can be done with any EZNEC program type, including the demo:

1. Click Open.
2. Select BYDipole.EZ and click Open in the file selection dialog box.
3. Click SWR. Enter 14 for the start frequency, 15 for the stop frequency, and .05 for the frequency step. Click Run.
4. Using the arrow keys or the mouse, move the cursor in the SWR display to the points where SWR is about 2. These are about 14.1 and 14.75 MHz, indicating a 2:1 SWR bandwidth of about 650 kHz.
5. Click Wires in the main window to open the Wires Window.
6. In the Diameter column, change the Diameter from #12 to 6 to represent a 6 inch diameter cage. (Don't put a "#" in front of the 6.) Press the Enter key to finalize the change.
7. Click SWR. Change the start frequency from 14 to 13 and click Run.
8. In the SWR display, move the cursor as before, and note that the 2:1 SWR bandwidth is now about 1.35 MHz, about twice what it was for the original antenna made from #12 wire.

Now you're a Reg-certified expert, even if that took you a month of Sundays to do.

You can also get a great deal of additional information from EZNEC, such as the feedpoint impedance and SWR at any frequency, the pattern, and effect of height and ground characteristics.

If that took you a month of Sundays, you might think a bit about what's reduced your capabilities to that level.

Roy Lewallen, W7EL

1: No more automatic renewals. Individuals must retest and
pass all elements required for their license class.

2: The passing score for written exams needs to be raised to 85%.

3: Code elements should be 13 wpm for General, and 20 wpm for Extra.

4: Make the no-code license one year non-renewable.

Let's take back ham radio.

73

2582. It's amazing what people will say to try to justify dumbing down Amateur Radio.

Message-ID: <S6SdndRQ4pbP0nvZRVnysQ@bt.com>
Source record: 54324

Frank,

You don't mention frequency. I assume it is still 8.07 MHz.

There's something seriously wrong!

The only change you have made (or I think you have changed) is to increase the number of radials from 36 to 99.

Yet, for a length of 10 metres, the resistance of the radials ground connection has INCREASED from a few ohms (for 36 radials) to 20.7 ohms (for 99 radials).

This is impossible! It should either decrease to an even lower value or at least remain the same.

Although I am not particularly interested in radiation resistance, there is also something seriously wrong with Rrad. Rrad for a 1/4-wave vertical ought to be in the region of 34 ohms - not as low as 13 ohms.

I think you use Rrad to calculate radials input resistance in which I AM very interested.

I think you subtract the antenna input impedance, from the total impedance of antenna + radials, to obtain the radials input resistance.

Rrad + conductor resistance is the feedpoint resistance of the antenna. You make it about 34 - 13 = 21 ohms too low.

If you subtract 21 ohms from YOUR radials input resistance values, then the EXPECTED very low input resistance values for 99 radials are obtained. But, of course, the radials input resistance should never become negative.

If you are unable to find where the error arises then use my value of Antenna Feedpoint Resistance = 33.8 ohms (which I have just calculated.)

Could you please investigate your results and apply corrections? If you are unable to determine the resonant input resistance of the 9-metre vertical antenna (jX = 0) then use my value of 33.8 ohms which, as likely as not, will not be exactly correct.

.....
.....

Then change antenna height to exactly 3 metres and change frequency to
about 25 MHz. The exact frequency being that at which the antenna is
1/4-wave resonant with the feedpoint reactance being zero. Repeat
measurements for 99 radials.

Such measurements will be far more accurate than if they were made in
the field.

I have some nice graphs of input impedance, R + jX, versus radial
length for work you have already done. They tell me quite a lot.

2590. Re: 9 m Monopole Analysis

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-19 00:52:40 UTC
From: Frank's <frank599@nospam.telus.net>
Message-ID: <shtFg.10245$Nz6.693@edtnps82>
Source record: 54226

Roy, I use a couple of methods. First, the RP card as follows:

RP 0 19 73 1002 -90 0 5.0 5.0

Where, the last digit of "XNDA" is "2", and the average gain
is calculated providing the following output:

AVERAGE POWER GAIN= 3.00224E-01 SOLID ANGLE USED IN AVERAGING=(2.0000)*PI
STERADIANS.

POWER RADIATED ASSUMING RADIATION INTO 4*PI STERADIANS = 1.15944E+01 WATTS

The input power for this particular test was 38.619 W.

As a verification I numerically integrate (Excel) the total radiated E-field
over a hemispherical region.
The elemental area I use is r^2*sine(theta)*d(theta)*d(phi). Of course
the E field is normalized to 1 m, and "r" is obviously "1". d(phi), and
d(theta) are both one degree.
The results are in very close agreement with the radiation, as above,
in 4*PI Steradians/2. I therefore have a fairly accurate figure for
the total radiated power without the surface wave.

For the next step I use the following RP card:
RP 1 101 1 0000 200 0 -2 1 200. The problem is, of course,
that the results are only available in cylindrical coordinates.
Where the total ground wave, and sky wave, is computed in the far field
(Where I have taken the far field to be 200 meters at 8 MHz)
from Z = 200 to Z = 0, in steps of 2 meters (From theta(zenith) 45 to
90). I then normalize these data to a radial distance of 1 m; taking only
those data points close to (theta) integral degrees. Picking out
these data points, taken from the NEC output file, in Excel is a
fairly tedious process. I then "cut and paste" these normalized
data into my "integrating" Excel spread sheet; replacing the
previously computed "sky wave" data from 45 to 90 degrees.
These results then give me the total radiated power, including
the surface wave. I can then easily compute the contribution,
to the total radiated power, by the surface wave.

When I replace the data, in the integrating spread sheet, the data
at 44 degrees is very close to the 45 degree field strength, obtained
from the cylindrical coordinates.

Hope you managed to follow my rambling description. To say the
least it requires a lot of tedious data manipulation with Excel.
If you are interested I can e-mail my spread sheets, NEC input
and output files, etc.

Regards,

Frank (VE6CB)

Will a 50ohm to 112ohm unun current balun on the input side of the matchbox increase the output capability to handle an open wire fed 80meter dipole at 65' on 40meters? I am 'kinda' stuck with my feedline length of 80ft, so thought I would raise the input impedance to boost the output impedance capability. I am aiming for a 1 to 1 'indicated' VSWR. The differential cap is fully meshed (rotor to top plates) and the other cap is approx 50% meshed and the matchbox input VSWR is approx 2 to 1.
What say?

Glen
Don't know if I 100% agree with your code speeds but I do thing the NO Code
should be for 1 year and none renewable.
I had to take my license in front of the FCC and not so VE who may or may
not help you out to get a license.
As I am a big VHFer I don't know how these NO Code guys are going to
understand beacons. They are all code and most at 10 ~ 20 wpm. I guess the
next thing will be, they will want all beacons either digital or voice. YUK!
Not up in the GHZ range yet but maybe some day.

Dear Roy,

But the subject matter is Cage Dipoles.

How many man-hours would it take a novice to enter into Eznec, two, in line with each other, spaced apart, cylindrical cages, 2-feet in diameter consisting of 32, 14-gauge wires, with 4 end rings, with time required to diagnose and eliminate the dozen or more bugs which are sure to be introduced.

That is, of course, if the free version will accept such an input.

We will forget the 10-day induction course.

How long would it take an expert like yourself to enter and fully analyse such a dipole. Bear in mind you would have to enter dipoles consisting of 2, 4, 8, 16, 32 and 64 wires, plus end rings, of say 4 different wire gauges. And obtain the resonant frequencies, input impedances and SWRs of all possible combinations.

You will say Eznec is probably more accurate.

But DIPCAGE2 will do the same job in a few minutes with an accuracy quite good enough for the intended purpose. CB-ers can use it.

With Eznec, before the job was finished I would have forgotten what it was all about, strayed off course and ventured into magloops.

To keep you happy, I will repeat what I have said before and say that Eznec does an excellent job in those tasks for which it is primarily intended. What better compliment? I am not in competition with you.

Reg, G4FGQ.

My notuner antenna at http://www.qsl.net/w5dxp/notuner.htm is pretty
close to what you have. Increasing your feedline length to 94-100 ft.
might solve your problem without the unun. The unun actually could
make the problem worse since you don't know if that 2:1 SWR is 100
ohms or 25 ohms or something in between with reactance.

2599. Re: Vertical radiation from horizontal dipole?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-19 03:44:28 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <12ed290mv4kekea@corp.supernews.com>
Source record: 54234

I don't have any link handy, but it's easy to explain.

Ground isn't necessary. Consider a horizontal dipole in free space. Position yourself directly in line with the antenna, some distance away, so all you see of the antenna is a dot. Now, move directly upward or downward. The antenna now looks like a vertical line(*). The radiation from the antenna at the point where you are is purely vertically polarized, for the same reason it's purely horizontally polarized when you're directly broadside to the antenna.

The only directions in which the dipole will radiate a purely horizontally polarized signal are in the horizontal plane of the antenna, or exactly at right angles (broadside) to the antenna. In the vertical plane containing the antenna, it's purely vertically polarized. In all other directions, it's a combination of the two. (In other words, the polarization angle of the total field is neither vertical nor horizontal.)

Here's an illustration you can do with the demo version of EZNEC. Open the Dipole1.ez example file, which is a dipole in free space. In the main window, click the Desc Options line. In the Desc Options dialog box, select the Plot and Fields tabs if not already active, and select "Vert, Horiz" (not "Vert, Horiz, Total") in the Fields To Plot frame. Then click Ok to close the box. (Note: The "Vert, Horiz" option, without the "Total", isn't available in EZNEC v. 3.0, including EZNEC-ARRL.)

The example file is set up to plot the pattern in the horizontal plane of the antenna. If you click FF Plot, you'll see only a horizontally polarized field. That's because the field is purely horizontally polarized in the horizontal plane of the antenna, as I mentioned earlier. The ends of the antenna are up and down on the plot, and broadside is to the left and right.

Now in the main window, change the elevation angle to 45 degrees. Do this by clicking on the Elevation Angle line, entering 45 in the dialog box, then clicking Ok. This moves the observer above the horizontal plane of the antenna. The observation point (assumed very far from the antenna) follows a circle which is equidistant from the antenna and the horizontal plane containing the antenna. That is, it maintains a constant distance and an angle of 45 degrees above horizontal from the antenna. Click FF Plot to see the result. Now you can see that when you're directly broadside to the antenna (left and right on the plot), the field is purely horizontally polarized -- the vertical polarization component is zero. But directly in line with the ends of the antenna, the polarization is purely vertical. The top and bottom directions of the plot correspond to the position you were in when you saw the antenna

as a vertical line.

Vertically and horizontally polarized components reflect differently from the ground. So in directions where both are present, one can be reinforced while the other is attenuated, resulting in a different mix after reflection. (But reflection won't change a horizontally polarized component to vertically polarized or vice-versa.) For example, a vertically polarized field reinforces when reflecting from a perfect ground at a low angle, while a horizontally polarized signal cancels. This ends up enhancing the vertically polarized component at low angles when both are present. (Remember, though, this is perfect ground -- real ground, except salt water, behaves quite differently.)

Finally, let me emphasize that there's really only one E field from the antenna, with one polarization angle. Separating it into vertically and horizontally polarized components is simply a convenience used for calculations and as an aid in understanding, much like separating two currents into common and differential (even and odd) mode components. The principle of superposition allows us to conceptually split the field into components, analyze each separately, then recombine the results, getting the same answer we'd get if we had done the analysis on the total field.

(*) More precisely, the projection of the antenna on a vertical plane passing through your position is a vertical line. Visually, you can't tell if the antenna is a short vertical wire or a longer horizontal one you're seeing end-on. The nature of the radiation in your direction is also the same for the two situations.

Hi Reg

I sure dont mean to become involved with the discussion on Cage Dipoles,
and which method of analyzing them, is better.
I do want to give some data concerning the time needed to learn to use
EZNEC. It isnt necessary to devote the time of a 10 day course in order to
be able to get alot of good/valuable data from EZNEC.
At Richard Clark's encouragement, I bought Roy's EZNEC program a couple
weeks ago. I was able to get good data from the program that same day,
The program is not mysterious.
I write this post to make it clear that EZNEC can be learned quickly by
anyone who trys, and can be learned in one day. I dont inply that I am a
well qualified EZNEC operator, but I have learned so much about the antenna
I am investigating that I really treasure this EZNEC program, and recommend
it to any HAM who has interest in understanding antennas.

Jerry

Jerry,

The truth probably lies somewhere between your view and Reg's.

Whilst you may have been able to construct a simple model in a very
short time, being confident that you have a valid model on even modest
antennas takes much more experience and knowledge.

I think it is another of those cases where the more I learn, the less
I know. You may find the same in time.

Hi Owen

I am not qualified to comment on Reg's information on either computer
programs or antennas in general. I am not far from being a beginer at
antenna design by today's standards. But I was able to get decent data on
a 4 dipole array circularly polarized array that requires some phasing of

the dipoles. By my standards, that isnt a modest antenna. Richard Clark was god enough to give guidance and encouragement via E-mail. That may account for my being to get such good data on the first day of trying EZNEC. But, he didnt actually provide data.
I am not qualified to differ with your observations concerning learning to use EZNEC. But, as must be clear by now, I am really impresed with this program and I consider it learnable with a little time and logic. It is my hope that I can encourage anyone who has interest in antenna design and understanding to 'give it a try'. It doesnt demand a formal training course. EZNEC is a nifty tool.

Hi

Does anyone know of any web or pc based Extra class training?

NOT* NOT* talking about license prep that just gives you test questions

Referring to somthing that actually teaches you the material you need to know for Extra Class

Just drilling me on the question pool prior to material review is just a exercise in memory w/o understanding /learning

I've got good books on it from arrl but thought pc/web based mught be fun and can't find any

thanks

Unless something goes wrong. The abuse of international
transactions is legendary. Even eBay, PayPal, et.al. seem
to acknowledge it. As another poster observed, if you are
a large-volume commercial vendor, you can "eat" the
occasional transaction gone wrong. But if you are selling
one-off things (boat-anchors or not) on eBay, etc. it has a
significant chilling effect, no matter what generation you
represent.

I find Reg's collection and EZNEC both valuable tools.
There are elements of EZNEC that I have not learned to use.
In Reg's collection each applet has a tight focus.
Yet neither can be considered complete solutions.

I am not certain that I am using either correctly without committing
the calculations to physical models.

After a few days down due to server problems the Sommer WEB site is back up and running. Talked to Alf (Owner) on Friday and he has invited me to the factory to meet some other Hams who are users and are visiting the factory to pick up more beams, They have been very busy with Govt orders from all around the global and also busy on some new design for the military. Most of there business seems to come from Govt agency's.

The WEB site is http://www.sommerantennas.com/

I am looking at this antenna since where I live (Central Fl) we have a great many lighting hits each summer plus the Hurricane potential. I am concerned with the SteppIR for the electrical motors and extra cables from the antenna down to the shack plus the very high humidity, and sometimes salty, corrosion problem potential with the strips inside the elements. The steppIR is a smaller looking beam and hides better than the sommer but if I also convert to a Hazer mount and I can lower it during bad weather. Still on the fence.

Ron W4LDE

PS - The next sun spot cycle is just around the corner and I want to be ready with a good antenna, not that the current TA-33 has not done a great job over the years, Trap less beams will perform better and its like adding a second amplifier by going to a LOG or to the steppIR and with the benefits of one feed line from 20-6 meters.

It's a nine-element phased octagon with eight verticals on the rim and
one in the center.

Back when Electrospace was making nice verticals, I had two of theirs
phased in a variable-delay configuration that did a very nice job from
eastern Canada back around 1979. I was fairly loud just about anywhere
and easily able to work all continents from there. Never did make it to
JA on 75 or 80 like the guys with four-squares, though. Those verticals
were 32 feet with a top-hat on them. They were excellent on 75 and
literal killers on 40. The first QSO I had on the first one I put up was
long-path to VK on 40m CW. It was still daylight at my end of the path!

Hello Brian,

This "dispute manufacturing" technique probably predates Robeson
by centuries... :-)

Anyway, it is an old, old technique of computer-modem comms and
was seen on ARPANET back before the first BBSs existed.

It's a way of bluff by the "manufacturer" to get around actually
replying to some challenge made by others. That's usually
accompanied by the manufacturer's veiled or outright personal
insults levelled against the challenger. Robeson uses the latter
more than the former.

LenAnderson@ieee.org

2614. Sommer versus SteppIR

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-19 19:23:32 UTC
From: jawod <jawod@fuse.net>
Message-ID: <8e917$44e765ad$453d9423$8718@FUSE.NET>
Source record: 54248

Ron was kind enough to stick with Sommer until the web page came back up.

Now that I have viewed both their page and the one for SteppIR, I have a question.

The Sommer has an interesting phase line approach like a log period array and the spacing of the elements is also a critical design feature.

The SteppIR has fixed elements that vary in their length per each band.

The SteppIR is elegant in its simplicity, the Sommer elegant in its complexity.

How important is element spacing for ANY design? Does the SteppIR suffer at all because of fixed element spacing?

Totally impractical, I know, but would the ideal beam design vary element length AND spacing?

"Slow," I've been involved in radio for 53 years. Most of that time
as a professional. As a part of that, I once "worked" a station
ON the moon. No bounce needed. Quarter million mile DX.
Can you top that as an amateur? :-)

Hi John,

Yes, just like adjusting the length (element spacing) of a telescope provides for focus and hence the best resolution for a given magnification. Fixed designs, of course, have these considerations nailed down ahead of time. Variable designs such as StepIR at some point have to be recognized as being generalized rather than optimized. That is, the spacing between elements has to be selected to suit the many possible bands and lengths of the elements. This spacing cannot serve all combinations optimally.

As long as things are going along swimmingly, m/c = motorcycle.

Add radio to motorcycle, then m/c = murdercycle.

Frank,

You might want to consider a scripting environment to build, run, and summarise NEC runs.

Windows lacks a good scripting language for this type of application. Fortunately there are others available, and at no charge. Two that I have used are PERL and Python.

I prefer PERL mainly for historical reasons and the huge base of packages to extend the PERL base, though Python is probably a better designed language, and less likely to change radically (as PERL looks likely to do with V6). Importantly, both natively support complex number type. For instance, you can write in PERL:

```
#calculate Zo and gamma
my $a=$R+i*2*PI*$this->{f}*$L;
my $b=$G+i*2*PI*$this->{f}*$C;
$this->{zo}=($a/$b)**0.5;
$this->{gamma}=($a*$b)**0.5;
```

PERL is excellent for reading megabytes of NEC output and extracting key figures for summarisation.

An example, I recently wanted to explore the relationship between predicted beamwidth (in E and H planes separately) and gain for DL6WU long boom Yagis. I built and ran literally hundreds of models with pattern reporting at 0.1deg intervals, producing over 50MB of output. Models were automatically generated from a PERL port of the DL6WU design algorithms, and NEC runs of the generated models were automated. Half power point was found by linear interpolation between 0.1deg points around the half power points. If I did that by hand, I would be working for months, whereas a half hour of scripting produced a solution that was more accurate and reusable.

Is there a place for Excel? Certainly, I usually create tab delimited summary files with PERL scripts and drop them on Excel to the final ad-hoc analysis and presentation. DPLOT is also a pretty neat tool for

graphical analysis and presentation. For example, the regression analysis of the data from the study above http://www.vk1od.net/dl6wu/new_pa2.gif was calculated and displayed using DPLOT.

Worth the investment in learning PERL (or the like)!

http://www.perl.org/ (You need the Activestate PERL for Windows.)

http://www.python.org/

And, there's REXX (several -- recommend Regina for one) which has
great string handling capabilities.

I haven't followed the fortunes of REXX since I taught some "Safe
REXX" courses in the ealy '90s.

I do recall that in the 80s, IBM wanted to hand it over to the ANSI to
be made a standard. That should have nobbled its progress sufficiently
to be overtaken by developments originating from the Unix world.

But yes, I see that enthusiasts have kept it alive. Does it have
(PC)REs, might be an option for people who don't want to embrace REs.

Noooooo. I worked a STATION on the moon, namely one of the
ALSEP (Apollo Lunar Surface Experiment Package). Sent a
command to the SWS (Solar Wind Spectrometer) part, got the
response back on earth. Two-way. The ALSEPs are now
silent, nobody can work them. :-)

2627. Re: 9 m Monopole Analysis

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-20 06:18:08 UTC
From: Frank's <frank599@nospam.telus.net>
Message-ID: <A8TFg.7683$395.4456@edtnps90>
Source record: 54262

Reg,

The frequency is still 8.07 MHz. I was also puzzled by the radiation
resistance, but I arrived at the value differently than in previous models.

Anyway, I think I have discovered the error. In computing the surface
wave at 200 m I assumed the loss would be insignificant. This does not
appear to be true. For example; at a 26 degree elevation angle
normalization of the E-field to one meter produces essentially the same
result from either: 200 meters, or 400 meters. At zero degree elevation
angle, where the surface wave dominates; normalization from 200 m
or 400 m produces significantly different results -- as shown below:

Elevation Distance E- field
Angle (m) normalized
(deg.) to 1 meter
(V)

26 200 83.0
26 400 83.3
0 200 67.5
0 400 45.5

I had this at the back of my mind when making the calculations.
To be honest it is pretty much a no brainer, since
it is well known that the surface wave diminishes rapidly at
the higher frequencies.

All your comments are noted. For the moment I would like to perform an
integration of the Poynting Vector in the near field. Hopefully it will
provide a more realistic radiation resistance. Now to figure out
how to do this in Excel.

I ship to anyone that wants to pay for it. I do avoid APO/FPO shipping, and not because of scams but because of very very poor delivery chances on anything not a 1 ounce letter.

I sent several boxes of supplies to friends serving in Iraq with the US Marine Corps...most of the boxes languished in a warehouse in Germany for about 4 weeks before being hauled to Iraq...then it was another 2 or 3 weeks befire they actually got the stuff. Needless to say, never ship a puppy or kitten to a war zone. I have one realative that was in Iraq for a year (the last time). I mailed him a Christmas package at the end of October. He got home in February and still hadn't received it.

I ship DX but the buyer has to pay for the shipping.

Yes, shipping to OIF/OEF is very very slow. This is because nobody wants to
go in there. Regular fuel shipments can take 2 weeks to cross the country.
Shipping to APO/AE (Europe), APO/AA (Americas) and APO/AP (Pacific region)
is fairly steady, at least going by Priority. Parcel Post or Media Mail go
by SAM (Space Available Mail) and can take months to get ANYWHERE within the
military postal system. This is because EVERY other class of mail gets
priority over SAM, and some of those parcels don't leave the mil hub for
weeks (stateside).

What I've done sending goodies to our troops is to use the flat rate
Priority Boxes available free at the post office. All you can stuff
into it for the 2 pounds rate or $8.10. Mose have been delivered within
a couple weeks.

If interested might check out http://www.anysolder.com

Hi

I have been given an EL-40XC 80m Add-on Inductors Kit for Adding 80m to
1/2 size G5RV, but no instructions as to how to trim/tune the G5RV
after fitting.

Anyone else fitted these and could possibly email me a copy of the
instructions?

Regards
Duncan

His, "Sorry Hans, MARS >>>IS<<< Amateur Radio." would make a good, quick, clean case study for some grad student of psychology. It has all of the elements of that pathology and google serves it up in seconds.

Quite true, Brian. Those of us who were here 1 to 2 years ago
had an eyefull of his continuous - but faulty - efforts to "tell" us
all about His fantasy of things. :-)

Mainly it was his abject refusal to back down when faced with
definitive directives by the government (DoD) in regard to the
Military Affiliate Radio System. Weeks went by without his
admitting that the Directive existed. His final communication
on the subject would NOT openly admit to error but was laced
with more personal insults on his challengers. Sad.

Source record: 54270

Hello friends:
My name is Ruben (EB5ESX) and i am from Spain.
I have to replace my vertical antenna becouse i am having a lot of mecanical problems with it.
It is an artesanal antenna made in Spain.
I live in a building and i can't install radial systems, becouse i have to install elevated in a mast.
I need an antenna like Cushcraft R8, Gap Titan, Diamond CP-6 or something like that with integrated radial systems.
Money is not the most important for me..... i am looking for a durable and efficient vertical antenna.
What antenna do you like?
Do you have some experience?

My antenna at this moment is an standard loaded 1/4 wave vertical with a lot of losses and very noisy.

Please... any help?

Thank's a lot.

news:aLfEg.400583$Mn5.137675@pd7tw3no...
I frequently see postings in the ham radio related newsgroups for items currently being offered on E-Bay.

All to often I that items will be shipped only to the lower 48 states, leaving hams in Hawaii, Alaska, and Canada out of the picture. What is the problem. In Canada we are well served by FEDEX and the United States Postal Service. Amateur radio equipment crosses the border with out any problem. I realize that Hawaii and Alaska may be a bit far from the "lower 48" but the same delivery services are available even though surface transportation may be a little bit slow. In the US you also have UPS, the folks in Brown which we Canadians prefer not to use because the often make the border crossing more difficult than it needs to be and we don't like getting stuck with brokerage fees.

So why the discrimination, if the buyer knows that delivery may take a little longer and is prepared to accept the fact then it becomes a non problem. If the seller is intimidated by the prospect of complicated paperwork, he needn't be. Please leave it up to the buyer to decide whether he wants to bib or not.

I can not speak for shipments to Europe, Africa, India, China, or the South Pacific but for fellow Americans, or friendly northern neighbours, I think that people should be prepared to deal with us.

Thanx for letting get this off my chest and I realize that I have cross posted this to four different newsgroups but I wanted to get to a broad audience.

> fun and can't find any

Here is what I did: I did purchase the ARRL Extra Class manual just to get a synopsis of the questions asked and one author's overly simplified explanations of the subject matter. I do have a BSEE degree from UW Madison but I must admit that, contrary to the assertions of many in this group, in my case at least it was not a "trivial" test nor do I believe it would be easy to memorize each question and answer in the 500 question pool. The PE EIT test is much harder because they equations for the same material are trickier. For this test, you must know what a smith chart is. For the EIT (FE) and PE, you "should" know what it is because a smith chart will permit you to more readily arrive at the answer. If you understand what a smith chart is, how it was derived and have used it for just a few example questions/answers as Google research will teach, such knowledge is good for all of these exams.

Search engines will give you papers, articles and all sorts of discussions on the materials covering each section in the test and you will now be able to improve your knowledge (review in my case) or learn (for someone with a degree). I think this is far better than paying money to some radio club instructor of questionable technical background who only promises to help you pass one test. Also, when using Google, you may discover that similar or the exact same questions are covered in other countries' tests (New Zealand, Great Britain, Canada to name a few) and some even appear in the commercial license exams. You will find that more than a few of the correct "answers" to the questions on the exam are technically controversial. When you get to that level of understanding you will be well under way to a perfect score. You may also have an inclination to write to the US VEC QPC to inform them of some of their wrong or ambiguous answers but once you discover that the test is based on a worldwide set of accepted questions, you will see that

there is no point in this and you will just give the answer they want for the test but know the correct answer for yourself.

So my answer is, use a search engine like Google...properly used, it is the best instruction tool available.

Such complete ignorance of MARS, yet somehow, he claims that he was the
Assistant NCOIC of a NMC MARS Station on Okinawa. Simply unbeleivable.

Sorry, I don't understand the question. What do you mean by solutions between components? Solutions to what? Or is the question about polarization between components? If so, what does that mean?

The original question and my answer involved only linearly polarized fields, not circular or elliptical.

Roy Lewallen, W7EL

Selective amnesia...

With the advent of the No-Code Technician license, memorization became
a bad, bad thing.

> >Ummm? There's no Morse Code test anymore?

Most issues of QST have a minimum of at least one walk down memory
lane, usually with a key or keyer in one hand.

I think everyone has some of that to one degree or another. It's
unhealthy to allow that fear to paralyze you.

There will be new challenges before us tomorrow, but we won't know
about them. We will still be arguing if a morse code exam is
necessary.

I'm surprised that Klein allows any feedback in his oscillator
circuits.

Huh? Lets let the FCC tell us that it is impractical to have everyone
take mode exams. Or lets let the council of VECs tul us the same
thing.

If the league pushes the morse testing issue too hard, it will become
obvious to the 25% that are members.

1957. The Russians. Sputnik. CW beacon signal on 20M.

And I wasn't born yet.

But the technilogy was worthwhile and moved forward - without morse
code.

Think what he may mean is: if you use a Circular
polarization , it will receive both horizontal,
and vertical polarization signals, equally well
tho at a decrease of 3 dB in signal , vs. horizontal
to horizontal, or vertical to vertical
polarization. A good way to observe this
optically, for LINEAR polarizations, would
be to find an old pair of sunglasses, useing
polarized lenses. break them in two, and then look
throuh BOTH lens's . As you rotate one, keeping
the other stationary, note the loss of light thru
them. At 90 degrees, it should be almost black!
but at 45, degrees, the degree of darkness (this
is for the stationary lens) will be about the same
if the rotated lense is moved either + or - 45
degrees (the equivalent of circular polarization
in an optic field. Don't know if this explaination
helps, but migh give it a try-- Jim NN7K

Which one of the the two is more efficient as a radiator & why?

1/2 wave vertical fed in the center with coax or one vertical 1/4 wave
with four 1/4 wave radials also fed in the center with coax?

2644. Re: id theft is crime -Mark, Just ignore them.

Mark, Just ignore them.

They only tease you because of the stupid things you say when you
follow up. Just ignore them and they'll give up.

Stop giving them reasons to tease you. It only makes you look
more stupid.

Take a break from the radio groups for a while, Maybe work on your
moon bounce some more.

> degrees (the equivalent of circular polarization
> in an optic field. Don't know if this explaination
> helps, but migh give it a try-- Jim NN7K

Unfortunately, it's not demonstrating circular polarization at all.

Circular polarization isn't the equivalent of 45 degree tilted linear polarization. The polarization of a circularly polarized wave (RF, light, or any other electromagnetic wave) rotates, one revolution per cycle. So over each period, the polarization rotates from vertical, through intermediate angles to horizontal, back to vertical but oriented the other direction, to reverse-oriented horizontal, back to vertical again. A 1 MHz field does this a million times per second.

If you view circularly polarized light through polarized sunglasses, the intensity will be the same regardless of how you rotate the glasses. If you pass circularly polarized light through one polarized lens, the light is linearly polarized on the other side. So rotating the second lens behind it illustrates only cross polarization of linearly polarized waves.

If you have a purely linearly polarized field, say, horizontal, and rotate a dipole in a vertical plane in that field (with the plane oriented so the field is broadside to the dipole), the signal received by the dipole will be maximum when the dipole is horizontal, zero when it's vertical ("cross polarization"), and intermediate values in between. This is the equivalent of the polarized sunglass experiment. But if the impinging field is circularly polarized, the received signal will be the same for any of the dipole orientations. This is because the

field is always aligned with the dipole for two instants every cycle (when the antenna response will be maximum), cross-polarized for two instants every cycle (when the antenna response is zero), and at some intermediate relative polarization for the rest of the cycle (when the antenna response will be greater than zero but less than the maximum). And the proportion of each is the same regardless of which position the dipole is rotated to. The 3 dB attenuation relative to a linearly polarized, optimally oriented field is due to the fact that the circularly polarized wave is cross-polarized to various degrees during the cycle and is optimally polarized only for those two instants each cycle. A dual situation exists with a circularly polarized antenna and linearly polarized field: a linearly polarized wave of any orientation is received equally with a right or left handed circularly polarized antenna. Any plane wave can be divided into either vertical and horizontal (or any two orthogonal) linear components, or into right and left handed circular components. Any linearly polarized wave has equal magnitude right and left handed circular components. Any circularly polarized wave has equal magnitude horizontal and vertical linear components. Hence the antenna responses discussed above.

Like a circularly polarized wave, a 45 degree linearly polarized wave also has equal magnitude horizontal and vertical components. But this doesn't make it the same as a circularly polarized wave. The horizontal and vertical components of a 45 degree linearly polarized wave are in time phase or 180 degrees out of phase; those of a circularly polarized wave are 90 degrees relative to each other. This essential difference causes the orientation of the linearly polarized field to stay fixed but the orientation of the circularly polarized field to rotate. Put two crossed dipoles close to each other and feed them in phase or 180 degrees out of phase, and you'll get a 45 degree linearly polarized field broadside to the antenna. Feed them in quadrature (90 degree relative phasing) and you'll get a circularly polarized field broadside to the antenna.

Linear and circular polarization are limiting special cases of the more general elliptical polarization. The polarization of an elliptically polarized field rotates each cycle, but the amplitude can also vary during the cycle. The ratio of the minimum amplitude to the maximum (or vice-versa, depending on the reference) is called the axial ratio. Circular polarization is the special case of elliptical polarization having an axial ratio of one. Linear polarization is the special case where the axial ratio is zero (or infinite, depending on the definition used for axial ratio). A general elliptically polarized wave can have different horizontal and vertical linear polarization components, and different right and left hand circular polarization components.

The vertical dipole has more horizontal gain than the groundplane. I
believe its about 1dB improvement.

Hi, Antenna Guys.

My FM antenna had the wire attachment posts ripped out by the wind. I'm wondering if I can solder to the aluminum? Then I'd epoxy over it. I'd just try it, but I'm afraid it might pop in my face or something.

Hams could save more lives by supporting a blood drive than than standing by waiting for that emergency to use morse code.
I hear about hams supporting public service, my daughter DID 75 hrs of public service last year as a ten year old Girl Scout. I learned CW even got up to 20 wpm but I dont think it should be any more of a requirement than any other mode of operation. There is a lot of hams who may not be able to save anyones lives but they could save their own by turning off the radio for an hour and taking a walk

Ruben--

Do you have room for a horizontal antenna? I have used a broadband antenna similar to the B&W multiband folded dipole. It is convenient in an urban environment, because a tuner is not required. With a single center support, it fits the top of a typical building. However, it is not as efficient as a full sized antenna, because there is an integral matching resistor that consumes some power.

Thanks for the info Owen, also the comments from Jonsey. The scripting languages look very interesting. From your sample code above it does look very logical and easy to use; not to mention that it can handle complex numbers.

Regards,

Frank

Ordinary solder, no, but there are solders specifically made for
aluminum.

Source record: 54142

HP/AGILENT 436A POWER METER - RF/Microwave [DIGITAL display]
CALIBRATED, PERFECT CONDITION, warranty, may include sensor cable on request
Do NOT reply on Newsgroup, if email: remove "death2spammers" strings in my address (repeated twice). Price $199/$229, shipping from Amplitech, Inc., New York, USA

Posted on Ebay, item# 330020367897. Goto www.ebay.com and enter "330020367897" (without quotation marks) into search window (or item#, etc.); BUY NOW OPTION is AVAILABLE, i.e. NO need to wait for Auction end ($199) - set to $229. Description is there (on Ebay), copied down here for your convenience, BUT to see PICTURES/etc do check that Ebay listing. Best done via Ebay - SAFE for you/me (my feedback is 100% positive there & 10+ years on Newsgroups), but if you're not into Ebay and unless a bid already placed, I can take it off and sell outside Ebay.
Description copied here (see pictures on Ebay):

Concise description as you can GET DETAILED DESCRIPTION/SPECS/MANUAL at AGILENT website (www.agilent.com->search->enter 436A, power). People who buy Test Equipment are professionals/engineers - know already the specific model specs or can quickly locate. HP/Agilent 436A is one of the most widely used/legacy RF/microwave powermeters, thus often supported in modern ATE software and even modern Agilent meters almost always offer 436A emulation mode (I personally never had a chance to automate it), HPIB/GPIB is included (back connector) and tested with ATE software OK, the address selection switch is inside.

1. CALIBRATED - VALID THRU JULY 2007
2. CONDITION is LIKE NEW. PULLED FROM WORKING ENVIRONMENT at AMPLITECH, Inc. (www.amplitechinc.com), one of the best-known RF/Microwave companies - a spin off of Miteq, Inc. Used as recent as yesterday for military amplifiers testing, assure you precisely calibrated/ready to be plugged into your environment

3. Sensor not included at this price, in fact I am using it with a new meter that didn't come with its own sensor, but I CAN add a near-new sensor cable at a very small fee, just email me.
4. As mentioned above, docs/specs/manuals are at Agilent website, it's a simple meter comparing to dual-head/modern meters.

Reason to sell
We're fortunate now to afford a company-wide upgrade program, e.g. for this powermeter we're now using a dual-head $5000 unit, so this original unit is up for sale. Will post an older/analog HP435 + waveguide sensor (thermistor type?) for $95 only - lookup my Ebay userID for "all items for sale by this

member" - should find that meter soon (again, pulled from working environment, but long ago, could be nice as secondary/backup meter).

Source record: 54143

Dear Owen and Richard:
I have arrived at this set very late and the hour is late. However, many, many years ago I was involved with the radio astronomy task of measuring (always two major numbers involved) the flux from a strong source. A reasonably predictable antenna gain was effected by using a very long horn antenna with a rectangular (it might have been square) cross section. The antenna was placed in a gully so that the source would pass through the beam once a sidereal day.

The scheme used to construct the antenna was innovative and non-trivial.

A classic, comparison measurement was effected. Are not all measurements comparisons? A dummy load was kept in ice water protected by a condom. A switching scheme was used to switch between the dummy and the antenna with an offset. I called it the HILLRAMS receiver. (High Isolation Low Loss Radio Astronomy Microwave Switched Receiver)

Since the bandwidth was the same for both sources, once a day we measured how much stronger the source was than the noise produced by a zero centigrade source. All analog/

At Ohio State I did something similar with, probably for the first time, actual digitizing that went to a computer (punched paper tape!). As I recall, I did worry about sample rate, but it was much faster than any changes being observed because a heavy LPF was used. (With the slow computers in use, I needed not to overdesign the rate too much.) It seems to me that if you have any reasonably fast filter fall-off, 11 kHz is plenty fast enough. But then, I am not too sure that I understand your concern and I am starting to ramble (though I am stone sober).

I am not EE trained and the ARRL Extra license manual worked very well
for me. A google search may work but, typically, you can get far afield
from what you want or need to pass the actual test.

My recommendation is to use ARRL material: it reviews the pertinent
material to allow you to pass the test AND it teaches you the theory
behind the questions. Not a deep treatise, mind you, but a good general
understanding.

My two cents.

As a general rule for a yagi antenna (assuming a fixed number of elements) the longer the boom length the greater the gain. Forced by economic matters yagis are more often squeezed into a smaller boom size than is optimum for best performance. Hence I don't think it is a any problem for the designers of the Step IR to optimize the performance of a ten meter antenna using the element spacing and boom length of a 20 meter antenna.

well there Is Robeson and Wismen Heil is better than them but.. How
many example does one need?

right now the sample rate isn't very good of Extras that are not
members of NCI

given your non disclosed call status you certainly don't count

My Hy-Gain AV-640 does a very good job. But dont forget - none of
these antennas can be mounted without guy ropes. I use 3mm
'starter-rope' that is sold in hardware stores. They label it as UV
resistant and having 180kg max. This rope was made as a starting rope
for lawnmower.

The radials a steel elements. around 1 m, hanging down very deep.

>
> Roy Lewallen, W7EL

By "solution" I mean to the problem of recovering as much
of the transmitted signal strength as possible.
More specifically under typical receiving conditions
where polarization of that transmitted signal
is affected by reflections, atmospheric conditions or
some other cause (what would be other causes?).

I am still confused by the relationship between the absolute
and relative terms, between the spatially and temporally changing
components, and between the analytical versus physical descriptions
of polarization.

Your very helpful follow-up to NN7K both refines and complicates
my understanding.

You wrote there about phasing linearly polarized orthogonal
transmission antennas:

> This essential difference causes the orientation of the linearly polarized
> field to stay fixed but the orientation of the circularly polarized field
> to rotate. Put two crossed dipoles close to each other and feed them
> in phase or 180 degrees out of phase, and you'll get a 45 degree linearly polarized
> field broadside to the antenna. Feed them in quadrature (90 degree
> relative phasing) and you'll get a circularly polarized field broadside
> to the antenna.

Please correct me where I am wrong here.
From what you wrote:

One antenna is transmitting a "horizontally" polarized
(electric) field with a time varying electric amplitude A(t):

B_h = A(t)*cos(0) = A(t)
B_v = A(t)*sin(0) = 0

where "horizontal" is represented by an angle of zero degrees
in the transmitter's coordinates, and B_h and B_v are it's
respective horizontal and vertical e-field strengths.

Similarly the other transmitting antenna is vertically polarized:

C_h = A(t)*cos(90) = 0
C_v = A(t)*sin(90) = A(t)

again where "vertical" is represented by an angle of 90 degrees
in the transmitter's coordinates.

Superposing these two fields yields a 45 degree linear field
polarization (45 degrees relative to the transmitter's coordinates)
As far as the transmitter is concerned this polarization will
be the same for every point in free space. This is ignoring the
observer's relative perspective on the transmitter.

To get a circularly polarized field (again, relative to the
transmitter's coordinates irrespective of any receiver)
feeding the two linearly polarized antennas in quadrature
would be equivalent to:

B_h = A(t)*cos(0) = A(t)
B_v = A(t)*sin(0) = 0
and
C_h = A(t+90)*cos(90) = 0
C_v = A(t+90)*sin(90) = A(t+90)

Where A(t+90) represents the signal A(t) shifted
90 degrees relative to the carrier frequency.

Signal A(t) is not equal to A(t+90) at the every point in
free space and so they will interfere. This would create
a spatially and temporally changing carrier amplitude?

Circular polarization is not due to the superposition of
two orthogonal linearly polarized fields at a receiving dipole
where one of the field's linear polarization is rotated
90 degrees with respect to the other. As you pointed out,
that's just a 45 degree linear polarization and it does
not change from one point in free space to the next.

So I don't understand how two same frequency carriers
where one is 90 out of phase with the other creates a
circularly polarized wave since their resultant is not
in the polarization plane but along the direction of
the field's propagation.

Wouldn't the phase between the electric and magnetic
fields have to be different (other than 90 degrees)
to create a circularly polarized wave? If so can
circular polarization be described as changing more
or less than once per cycle?

Any single linearly polarized field can be parametrized
into two circularly polarized fields (represented
as the superposition of two circularly polarized fields).
Therefore, any receiver with a horizontal dipole,
can be described as receiving two circularly polarized waves.
But this would be an analytical description of the receiver,
rather than a physical description of the field that was
actually sent.

What amount of radio signal attenuation is typically
attributed to polarization mismatches?

Thanks for your help, I realize that polarization
can be complicated to describe in full detail.
I do not know much about how it is delt with
in terms of radio reception.

Its all a matter of reference. I was thinking in terms of dBi.... a
vertical has 3dBi gain, a ground plane, 2 dBi.

Hi Ed,

The missing "reference" is that the vertical is planted into earth
(because both antennas are vertical, this missing "reference" should
be very explicitly stated). However, in the context of 2M FM, an
antenna planted into the ground, unless that ground happens to be the
peak of a mountain, is rather a very poor option for 1dB "gain."

Hi Ed,

In that case, the gains are identical. A vertical "planted into the
earth" exhibits a higher gain (given many other considerations) than
an elevated vertical - be that elevated vertical be a dipole or a
ground plane design (which is simply another dipole, albeit rather
more elaborate).

>You want to slam all Extras because of one lid?

Tsk, tsk, tsk, anony-mousie "Jawod," that LID is doing the
"slamming," not I. :-)

Why are YOU so upset, "Jawod?" You don't exist. You are
a mere figment of your own imagination. The FCC doesn't
license figments...

>Perhaps that same psych
>grad student has some prime real estate closer to (your) home?

Which home? The one in California or the one in Washington
(state)? :-)

As far as the southern home is concerned, its address has
been printed with every article I had published in HAM
RADIO magazine. It's still the same address.

No problem on "knowing psych" people. Graduates...of USC,
(University of California) of UI (University of Illinois),
of University of Wisconsin at Madison. "Students?" Not
greatly acquainted with any, only their instructors. My
wife has two Masters Degrees, one of which required a
thorough education in mental health...and she was licensed
in two states for private practice.

"Jawod," what you just attempted to do was INTIMIDATE
through suggestion. Old, old BLUFF. Didn't work, of
course, but you just had to try the bully game, didn't
you? :-)

That bluff-intimidation ploy has been used for years and
years on BBSs and Internet...almost always by those too
cowardly to reveal their true identity. [few of us would
be "scared" if we found out how you REALLY are...] Try
not to be such a blatant bullshitter in the future, OK?

Beep, beep and bye-eeee...

ARRL views itself as "representative" of the ARS. Unfortunately,
the 'ARS' stands for Amateur Radiotelegraphy Society.

>> >> What current exam? Memorizing answers and writing them down isn't a

>
>I think everyone has some of that to one degree or another. It's
>unhealthy to allow that fear to paralyze you.

Yes and no. When it comes to Status-Rank-Privilege the fear
of LOSS of those seems to take on a life of its own. They
are SOMEBODIES at present, complete with federally-authorized
permission and certificates (suitable for framing) to "prove"
that. Take away the status, the rank, and perhaps privileges
and they are (in their own perception) "lesser beings." That
seems to work with the normal prime survival rule in humans.

>circuits.

Positive feedback (pro-code type) allowed. Negative feedback
is "dishonest." :-)

>
>> >YES!!!
>
>> [no...]
>
>Huh? Lets let the FCC tell us that it is impractical to have everyone
>take mode exams. Or lets let the council of VECs tul us the same
>thing.

Klein, armed only with an air of self-importance and inflated
claims of experience, is shooting from the lip.

IF and only IF such a "practical test" were imposed, the time
of testing EACH license applicant would increase dramatically.

VEs would have to spend at least a day's worth of time on each
applicant. I think VEs would object to such enforced labor in
a Volunteer task.

As with other proponents of a "practical test," Klein hasn't
explained WHO will maintain the equipment necessary for such
"practical tests" nor make up the much-more-complicated test
tasks and grading. Who will pay for the equipment that would
cover "everything" as to modes and operations? The FCC? The
VECs? Who will pay the VEs for their (essentially) "jobs"?

Klein assigns an importance and ability of AMATEUR activities
in radio far higher than professional ones. This is wrong,
but it serves his and other pro-coders self-image of being
"better" because they passed tests lobbied-for by those of
the same mindset.

>If the league pushes the morse testing issue too hard, it will become
>obvious to the 25% that are members.

I don't think so. The Amateur Radiotelegraphy Society is very
firmly SET in their ideas of keeping the "heritage" and
"tradition" of being a living museum of archaic radio. Those
firm believers and worshippers at the Church of St. Hiram are
disciples and they haven't had their last supper yet.

>> >I think it is you who don't know where you're going with this

>
>Actuarial tables abound to deal with that kind of thinking.

That's a draconian sort of realism...but, unfortunately true.

Believers can be extremely stubborn. "The only way you'll stop
morse code is to pry my code key from my cold, dead fingers"
isn't an idle threat. Morsemen as SOMEBODIES and they will
hold that banner high even as they crumble.

>Yep. Testing must become more "legitimate" for hobbyists than for
>professionals.

Self-inflation of importance, meaningless in reality.

>> >The exam can be anything your VEC wants it to be. We learned this when
>> >the ARRL went from administering a Morse Code Exam at 5WPM to

>QP revisions, guys like Klein are silent; absent.

That shows they are only whining, not thinking. In order to
preserve their self-image of importance they have to continue
whining on how they are so self-important. If they REALLY
CARED about their sacred amateurism they would get busy and
work at preserving things. Perhaps mumifying instead of
preservation...

>> What all that concentration on the "written tests" is about is
>> just a DIVERSION to keep from replying on the singular morse

>
>Old and tired.

It is, but they are self-important because of a singular skill
test that makes them "better" than others..."better" in ways
not even remotely connected to that singular skill test.

>> Seems to me that COLLEGE-level course tests that I took had a
>> LOT of memorization. Maybe we should all slam the academic

I was thinking about something I read a while back
in Paul Nahin's book "Science of Radio" about
synchronized transmitters and receivers,
and about something in Richard Feynman's QED.

Roy Lewallen said several things that for a moment
made me wonder whether quantum entanglement
could be demonstrated in radio waves as it can be
for light. I'll have to re-read Nahin's book.

Karo brand corn syrup has an interesting property.
It will rotate the linear polarization of light passing through it
by different amounts depending on the frequency.
This can easily be seen by placing a small jar of
Karo syrup between to linear polarizers and rotating
them. Different angles between the linear polarizers
will result in a different color being seen in the Karo jar.
Note the color seen also depends on the thickness of
the jar, so if you use a round jar you will see several
different colors but they will still change when you rotate
the polarizers. I was wondering if a radio receiver could be
frequency tuned based on polarization in such a manner.

So many people need to pump themselves up here. Truly amazing.

I have no interest in your wife's degrees, your home(s), your friends or anything else. Nor was any "bluff" intended.

My post was in response to the quote above. If that wasn't you, my apologies. It was a simple statement.

Whew. Sometimes accessing this group is like stepping in dogshit.

2691. Sommer design

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-21 20:37:09 UTC
From: jawod <jawod@fuse.net>
Message-ID: <940d3$44ea19ef$453d9423$32391@FUSE.NET>
Source record: 54176

The Sommer design is stated as having "phasing line similar to log periodic array". Am I correct in thinking that it is not a true LPA because of different element sizing and spacing than an LPA?

If so, what is the advantage of the "LPA-like" phasing line in this case?

At the Anderscum residence, perhaps.

For the nearly 700,000 of us with licenses, it's the Amateur Radio
Service.

Note: Leonard H. Anderson is not an FCC licensee in that service.

You would know, Lennie...

It's YOU that perceives that loss...For by taking the same test
mere mortals do, you "surrender" your "I Was An Electronics Engineer"
brags.

Snip of usual Anti-Amateur Radio rhetoric.

> >Odd, saying what you mean and meaning what you say have become

>
> Heh heh, I wouldn't doubt it...

"Armageddon"...?!?!

No one announced "armageddon" in any release that I am aware of.

Why did you?

Yet more evidence of why it's better to have Lennie "Can't Pass An
Exam" Anderson on the outside looking in.

Steve, K4YZ

At HF considerable fading, including selective frequency fading, is
caused by polarization shift. But it's not easy to create a receiving
antenna that's circularly polarized when a ground reflection is involved
(because ground reflection characteristics are functions of both
reflection angle and polarization), and even more difficult to do it in
more than one direction. If you can build the antenna, it should reduce
polarization shift fading. You still have the problem of fading due to
multipath interference.

> in the polarization plane but along the direction of

> the field's propagation.

Here's your error. In free space in the far field, there is no tilt in the E field in the direction of propagation; the field is what we call a plane wave. At any instant, the E field is oriented normal to the direction of travel. If you look at a circularly polarized wave at a fixed location, you'll see it rotate in the plane normal to the direction of propagation. If you freeze the wave in time, you'll see that the field orientation is a rotating vector, again rotating in a plane normal to the direction of propagation. Think of the path of an airplane propeller as the plane flies.

>
> Wouldn't the phase between the electric and magnetic
> fields have to be different (other than 90 degrees)
> to create a circularly polarized wave?

No. Traditionally, polarization refers only to the orientation of the electric field. Once the phase of the E field is known, both the magnitude and phase of the H field can be found. The ratio between the two is called the impedance of the medium, and is dictated solely by the nature of the medium through which it travels. In free space, the ratio of E to H is a purely real number (about 377 ohms), so E and H are always in phase. You can't alter that except in the field close to an antenna (the near field).

> If so can
> circular polarization be described as changing more
> or less than once per cycle?

No. The field rotates exactly one revolution per cycle, never any more or less.

> Any single linearly polarized field can be parametrized
> into two circularly polarized fields (represented
> as the superposition of two circularly polarized fields).
> Therefore, any receiver with a horizontal dipole,
> can be described as receiving two circularly polarized waves.
> But this would be an analytical description of the receiver,
> rather than a physical description of the field that was
> actually sent.

The splitting of a single field into two orthogonal components such as horizontal and vertical linear or left and right circular is a way of describing the field itself. It's useful for such purposes as determining what the response of a particular kind of antenna would be.

> What amount of radio signal attenuation is typically
> attributed to polarization mismatches?

I commonly see fades of 20 - 30 dB on 40 meters which I can reverse by switching between horizontal and vertical antennas -- that is, at the bottom of the fade I can switch to the other antenna and restore the

signal. So it's mainly due to polarization shift. On line of sight paths, I believe the attenuation can be quite severe. I don't know what proportion of the frequency selective fading you hear on distant AM signals is due to polarization shift and how much to multipath interference.

>. . .

There should be some good explanations (and undoubtedly also some bad ones) on the web, and the topic is covered to some extent in most electromagnetics texts.

Dextrose (for right) and levulose (for left) -- aka glucose and fructose, the components of sucrose, ordinary table sugar -- are named for the direction in which they rotate the polarization of light.

> Its all a matter of reference. I was thinking in terms of dBi.... a
>vertical has 3dBi gain, a ground plane, 2 dBi.

Here is a ground plane with a free-space gain greater than 2.9 dBi and
an SWR less than 1.2 at its design frequency (as given by NEC2):

```
CM Groundplane antenna for MURS (151.8 Mhz)
CE
GW 1 19 0 0 0 0 0 0.444243 0.000813863
GW 2 21 0 0 0 0 0.163546 -0.4506 0.000813863
GW 3 21 0 0 0 0 -0.163546 -0.4506 0.000813863
GW 4 21 0 0 0 -0.163546 0 -0.4506 0.000813863
GW 5 21 0 0 0 0.163546 0 -0.4506 0.000813863
GE 0
FR 0 31 0 0 145 0.33
EX 0 1 1 0 1
RP 0 31 73 1001 0, 0, 3, 5, 10000, 0
EN
```

It uses 14 AWG wire and consists of a 17-1/2 inch vertical, and 4
18-7/8 inch radials symmetrically placed at about 20 degrees with
respect to the vertical axis:

```
|
|
| A A = 17-1/2 in
| B = 18-7/8 in
| T = 2*19.95 degrees
/ \ C = 12-7/8 in
/ T \ B
/ \ (only 2 radials shown)
/ \
<-- C -->
```

From: Dave <W1MCE@comcast.net>
Message-ID: <POadnWTtybc-tXfZnZ2dnUVZ_rSdnZ2d@comcast.com>
Source record: 54185

I Googled SommerAntennas so I could get a look at what you are writing about and got a 'Could not be found' message for <http://www.sommerantennas.com/>.

In either case a LP design has many solutions for a given frequency range for number of elements, spacing, etc. A true LPDA will operate anywhere within it's minimum and maximum frequency range. That is: a 13.5 to 33 MHz design will operate ANYWHERE within that range and meet published specifications for Gain, VSWR, efficiency, without the need for ANY on tower tuning, etc. [An LP does NOT have the 20, 17, 15, 12 and 10 meter bands!!! It has FULL coverage ANYWHERE within it's published minimum and maximum frequencies.]

A LP design is a driven array NOT a parasitic [YAGI} design. It's major advantage is the very broad bandwidth it covers without tuning, traps, or stubs. It provides slightly less 'gain' than a 3 element triband Yagi. A Long John single band YAGI will have 3 to 6 dB additional gain above a LP, but the YAGI is band limited.

I don't have much experience with earth verticals.... mostly HF I would say, and that's another animal altoghther than the question the original poster raised here on VHF antennas.

The vast majority of my experience with groundplanes and verticals is at VHF and above. Every reference and factory specification for standard grounplane and vertical dipole antennas I've seen indicates the standard vertical dipole has a horizontal gain of 3 dBi, and the groundplane 2.1 dBi. I don't know where some others are finding the non-industry standard figures I have seen cited here.

Hi John,

Yes, it is an interesting coupling mechanism. It is something of a
delta match going from element to element with a phase reversal (to
boost the number of degrees that would otherwise force a greater
distance into the boom).

Hi Ed,

Those are pretty curious references then. Why would they dwell on the
HORIZONTAL gains of VERTICAL antennas? There must be something left
unsaid in what you are trying to express because cross polarization
would drive down sensitivities by 20 to 30 dB.

For another matter, those values you quote bear very little
resemblence to typical 2M FM operation, unless it is from the Space
Shuttle. Height above ground variations in gain easily washes over
any differences you might perceive. I can see a variation of 2dB in
just raising a groundplane from 40" off the turf to 120".

Usenet radio groups were a lot nicer before ham radio got dumbed down. Now the ham radio groups have a CB feel to them.

Some old time ham in the area needs to step in and show the scouts how ham radio and CW can save lives and help communities in emergencies.

Nickle Generals & Extra's have a hard time promoting amateur radio. All they want to do is promote dumbing it down more. It's no wonder the scouts aren't interested.

Dave,John

Just tried the WEB site and I had to hit the try again button to get the response, I spoke with Alf the Owner last Friday and advised him of the site trouble, he said that the server was giving them fits. The Sommer factory located in Geneva FL was going at fill steam to meet the Govt (Military demands) from around the world. Several Govt have standardized on the Sommer antenna. Its not that Ham Radio has taken a

back seat but you go where the money is!

Alf invited me to come to the factory, see the antennas up in the air and see what they have to offer. Alf claims that his XP504 LP has the same gain as a 4-element Yagi on the ham bands. He has the review facts from a French Government study. The only problem I can see with this antenna is the weight (73#'s) compared to a lower weight of 43#'s form SteppIR and from other antennas. I was hoping to get access to the QTH.net archives but they have disappeared. Was looking to read what others had to say. Anyone know how to get archives or where they are?

The SteppIR caught my attention a few years back and I was considering one of those antennas as a replacement for my current TA-33 trap style tribander which has performed very well but lacks the WARC bands plus the six meter band if I want. For 30 and 40 meters there is a kit for the Sommer but from what I have read your better off with a dipole for the added costs. Several articles I have read seem to backup what Alf had to say plus reports from on the air comparisons. From what I hear it is built like a tank with quality products.

Give the site another try and keep hitting the refresh button and it will finally respond. After my visit which I hope happens this coming Saturday I give you and the rest a report.

ROFLMAO!

.... And you've made me think of possibly joining CAP.

Testimonials like yours will bring a smile to every Real hams face. :-)

Just learn the code to 22 wpm. That would be a nice edge if you still had
to take a 20 wpm CW test. But if you can only get your speed up to 16 or
17 words per minute, upgrade anyway. We need good people like you on the
ham bands and on usenet. LOL

Markie, Just ignore them.

They only tease you because of the stupid things you say when you
follow up. Just ignore them and they'll give up.

Stop giving them reasons to tease you. It only makes you look
more stupid.

Take a break from the radio groups for a while, Maybe work on your
moon bounce some more or clean up your yard.

Richard,

You and I seem to be talking different languages !! :^)

My reference to horizontal gain is gain measured in the horizontal
plane..... that is, measurements are taken broadside to the vertical
antenna elements, in this case, both the vertical dipole and a
groundplane.

Gain measurements taken in any other plane in any other plane than
horizontal tend to be rather useless since most VHF mobile communications
takes place horizontally..... even distant repeaters tend to be close to
the horizon.

Cross polarization is not an issue in VHF operations since all
commercial and amateur FM operations I'm familiar with use vertical
polarization.

As far as height variations having effect on gain.... you are
talking about path gain, or system gain. I am speaking specifically of
antenna gain, which I believed to be the question of the original poster.

And as I have already pointed out, most factory specifications
for vertical dipoles and groundplane antennas are as I already listed.

Ed K7AAT

2725. Re: Vertical radiation from horizontal dipole?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-22 00:55:25 UTC

Message-ID: <1156208125.913100.306680@75g2000cwc.googlegroups.com>
Source record: 54210

Dear Roy:

Stupendous explanation, I also think, as Denny, that should be included in the antenna book to highlight this aspect, because a lot of friends tends to believe that the horizontal dipole only emits with horizontal polarization...

In fact, my question arose when comparing the relative difference between the vertical field and the horizontal one in the free space and on the proximities of the real ground (or with the perfect ground also) and to notice a bigger intensity of the vertical field near to the ground (relative to the horizontal one), taking reference with the same relationship in the free space.

My hypothesis was that this would be due to an asymmetric distribution of the displacement currents taken place by the presence of the graund that would cancel part of the vertical field in low angles.

I was looking for the correct explanation of such an asymmetry. Now I think that your explanation, based on difference in the reflection coefficient, seems to be more appropriate.

It put my accent in "the low height", because I was in a friend's shack that uses EZNEC 3 (I am more familiarized with MMANA which I use because it is free and not because I prefers it to yours, that is very good) and I am got confused with automatic way of locating the outer ring, suggesting me a great intensity of vertical field (reason why the results they were too optimistic). It was my fault because the text on the results gives the outer ring value (but one so many times doesn't read the tiny letters...).

When, at your suggestion, download EZNEC 4 Demo, I realized (when opening Desc Options) that the 0 dB corresponded to an external ring of approximately -10 dB or less, (maybe it would be good a "warning" to avoid troubles at peoples as fool as me ;>))

Those first results took me to think that the vertical field could have more relevance on comunnications at short distance by terrestrial waves (very low angles) on the lowest bands...

Anyway, maybe the most interesting thing that has arisen of this question is to remember us that the horizontal dipole ¡doesn't sends only polarized horizontally waves..!

Thank very you for your quick answer and my congratulations for your great program.

Miguel Ghezzi (LU 6ETJ)

When are you leaving the group to go do that, "Slow?"

Oh, and while you're at it, why don't you inform the group
the date when amateur radio morse code saved ANYONE's life?
Betcha can't do it...

On 7 July 2006 the FCC released its Independent Panel report
on the worst natural disaster to hit the USA, Hurricane
Katrina. You can find it in the Federal Register of that
date. In there you can find an objective report on how much
radio amateurs helped their communities.

BTW, Comments on that Report are due on or before 21 August
2006...today. Have you sent in your Comment, "Slow?" No?

>Nickle Generals & Extra's have a hard time promoting amateur radio. All
>they want to do is promote dumbing it down more.

Tsk, if anyone was doing "dumbing it down more," they'd have
to outdo your own retrograde, freeze-it-in-YOUR-youth ham
radio, "Slow." Feel proud. You are practically a one-ham
show on dumbing down the service...

>It's no wonder the scouts aren't interested.

Tsk, you should have recited your own tale of saving the
Titanic...when you were asleep on the US California...

It's "minority rule" when ARRL lobbies for preservation of
morse code test for any amateur radio license class. The
ARRL membership is slightly less than a quarter of all US
amateur radio licensees.

Ahem...my reference was the old fairy tale, "The Emperor's New
Clothes." :-)

That's the one where a full-of-himself ruler ordered some new
clothes and the tailor buttered him up (while not sewing any
new clothes) so much that the Emperor bought into this pandering
to his ego and appeared in public with his "new clothes" (he was
naked). Needless to say, the public laughed and laughed at this

ridiculous spectacle. :-)

Robeson has been all full of himself in here about his alleged "USMC service" yet he has presented zero-point-zero evidence from anyone else (or any legitimate agency) that he ever served on active USMC duty for any of his claimed "18 years."

Even though he NOW thinks of himself AS the amateur radio service personified (anything against him is somehow against ALL radio amateurs), he is still parodying the "Emperor."

Source record: 54220

You should always run an average gain test when you have an unusually high or low field strength. Using EZNEC, the average gain shows as 1.227, or 0.89 dB, and this same average gain should be reported by NEC-2. That means that the actual gain is 0.89 dB less than what NEC-2 is reporting, or just about 2.0 dBi. If you don't understand what this test is, consult the NEC-2 manual. EZNEC users will find it indexed in the EZNEC manual.

I suggest you also do an average gain check on your 3 dBi vertical.

Isnt that the main point tho.... they have no power to do anything...

They are just sad ppl with nothing better to do. Next they will be
saying that
you should have to pay a monthly fee to use the airwaves...

Maybe have a subscription fee, that would stop most of the scum (yeh
right)

Cushcraft used to sell one, amongst others. Most commercial dipoles now are folded design, and designed for side mount on a tower or mast, so gain figures tend to include the effects of the mast... although they can be mounted on top of a tower or mast, too. Other than the certain physical advantages inherent in folded dipole design, the performance remains about the same as a standard halfwave dipole.

A quick check showed Andrew and Celwave (RFS Celwave) with current products along these lines. Couldn't find a decent site for Cushcraft, and didn't spend time looking for other vendors.

well a GMRS like license would surely do better asa filter than the
code test look at the code tested ham we have on the air now

I don't know about vertical dipoles for ham radio but many manufacturers
make them for marine applications. The vhf marine band antennas for
fiberglass boats are center fed vertical dipoles.

What part of the GMRS license would be a better filter?

The 5 year duration between renewals, the $75/£40 charge or just the
general way of applying for it?

Im not saying i disagree, just wondering what you meant..

having to pay to use the ARS freqs might be more of a deterant to those
with bad attiudes than a code test

not to say it would be a good filter but fee for license with the
license fee used for enforcement here in the state the license is free
(the tests cost something) and the FCC is always complaining it laks
any funding to go after ham violators I suspect you are a brit and so
this might escape you I should have been clearer

nice to see someone serious paying attention here I had assume the
flamers and trolls had driven them off

Thanks, Ron.

Yes, the website is up and down. If you can get on it, it's a fairly informative site. I didn't realize there was such a weight diff. I'm actually dreaming of my first tower several years away. Who knows, by then, a large nerfball sphere may digitally reproduce any propagation you wish...or at least that's one of my other dreams.

Is Alf referring to the XP504 as a log periodic dipole array? I have no intention of being a stickler...just curious. In the ARRL antenna book, there are several formulas to follow in order to design an LPDA and the XP504 doesn't look like it would conform. There is also a hybrid LP-Yagi, using a director parasitic element, listed there.

In my mind, the weight difference alone leans heavily (horrible pun) toward the SteppIR. Man, the Sommer is almost TWICE as heavy.

John
AB8O

PS, Is this Alf fuzzy and short? I may know him.

2744. Testing a theremocouople-type RF Ammeter

Newsgroup: rec.radio.amateur.antenna

Is is valid to test a thermocouple-type RF Ammeter using low
frequency (say 60 Hz) current? I did so and got quite
reasonable results. Hey, current is current, right?

I have three different thermocouple-type RF Ammeters, with
FS ranges of 1.5, 2.0 and 3.0 RF Amps that I wanted to test.
The 2 Amp meter has an external thermocouple (16 mV DC for 2.0 RF Amps)
and the other two have internal thermocouples.

I hooked them all up in series, and also in series with a
Fluke digital AC Ammeter, fed them from 6.3 VAC through a suitable
dropping resistor. All readings agreed within a few percent at various
currents.

Can I now assume that these meters will also function correctly at RF?

Thanks.

US Navy has two, at least, NT-66095 for the VHF aircraft band and a shortened version, NT-66095MOD, for the 160 MHz Marine band. Also, do a Google search on "dipole sleeve" and "dipole cage" to see a few others. Military also uses some biconical dipoles for receive only. They look like two funnels, connected together at the skinny end and are all mounted vertically for omni coverage, IIRC.

Would it be cheating to call the J-pole a vertical dipole? It is a free-space half-wave radiator, albeit end-fed.

It is somewhat easier to measure the RMS value of DC current than
mains AC current. It may be worth considering a DC calibration.

Cushcraft has spare-part problems in mij experience and Hygain not for
starters.
I had a Cushcraft R6000 and now a Hygain AV620 who has the same designer.
The pro for the AV620 is that the antenna has no traps only stubs.
IMHO the AV620 performs better then the R6000.
Wolfgangs advise to guy the antenne is treu because the antenna is catching
wind.That's also for the R6000.
IMHO the mount-material from Cuscraft is better then Hygain and the time to
contruct a R6000 is a lot shorter then a AV620.

I don't yet see how the B_h and C_v signals, A(t) and A(t+90),
(which appear serially on the feed line as a superposition)
get physically split into their respective h and v dipoles
(I can see that if they are, circular polarization results).

Besides the 90 carrier phase shift and the 90 angular shift
of the crossed dipoles, I figure there has to be one more part
that splits the orthogonal signal components in the feed line
into their respective dipoles (it would be a waste of energy to
send the B_h component through the vertical dipole).

Is this why circularly polarized antennas like this one
seem to have a vertical and horizontal radiator combined?
http://www.ccbroadcasters.com/images/antenn3.jpg
That's what had me thinking that circular polarization
had something to do with the E and H field phase difference
since it looks like a horiz loop integrally combined with a vert dipole.

Source record: 54090

At risk of being called a Troll, and having little else to do at present, I copy from another newsgroup the following text.

"Reg Edwards" wrote -

"The effect of an impedance mis-match at a coaxial connector of ordinary dimensions is practically zero at frequencies up to UHF.

Regardless of its other dimensions, the primary requirement of a mismatched connector is that its length should be appreciably less than 1/4-wavelength at the highest working frequency.

People are unnecessarily worried at VHF and below. Mix up 50 and 75-ohm connectors, and indeed connectors of unknown Zo, and carry on regardless.

For an analysis of performance, download in a few seconds and run immediately program CONNECT from website below."

Program CONNECT will calculate the effect on performance of inserting any relatively short length of line, of Zo different from system Zo, into the system. It's less than the inexperienced might imagine from reading frightening magazine and handbook articles about impedance and conjugate mis-matches.

If you have a short length of coax lying around, of unknown Zo, just use it!

==========

In these days of mobile telephones, etc., morse code just gets in the
way of emergencies.

But there's nothing to prevent people who appreciate and love the
language of Morse, the way it sings, its universality, its beauty,
from continuing to use it way into the future.

It is the beauty of Morse, in plain English, never mind the
abbreviations, which boy scouts and others who show an interest should
be taught to appreciate.

>the EZNEC manual.

You are correct--- an antenna cannot radiate more energy than was
input into it. Increasing the number of segments did not help the
accuracy of the model either. It appears that the angles are too
acute (40 degrees) for NEC-2 to model accurately. Changing the
geometry to avoid the smaller angles also produced an antenna with a
gain of 2 dBi as you suggested.

Perhaps you can advise me regarding the numerical stability of the
following omni-directional, which NEC indicates has a gain of 4 and a
VSWR<1.2 when fed with a 50ohm feedline at 151.75 Mhz.

The geometry consists of a 54.5 inch vertical with 4 35.625 inch
radials that are bent upward by about 11 degrees. The vertical is
made from 14 AWG wire, while the radials are 1/8 inch brazing rod.

```
CM High Gain Omni for MURS
CE
GW 1 29 0 0 0 0 0 1.38375 0.000813863

Yes, at HF the reflections from one impedance discontinuity
and the reflections from a complimentary impedance discontinuity
3 inches away almost entirely cancel each other.

Some of us are so cheeky as to use CATV, RG-6, Rg-8, R8-11, etc., with
no regard as to the supposed 'surge impedence'..
What is the load impedence of a 50 ohm antenna at any frequency removed
from its resonance point anyway?
If the antenna is 30 ohms or 80 ohms, with some reactance, does the SWR
meter notice the inexpensive run of supposed 70 ohm coax that you
cadged from the cable tv company?
Once in a while I get an antenna that is fed with bits and pieces of
this and that, which swears differently back at the shack than it did
at the antenna feed point... Inserting another 5 or 10 feet of coax
jumper usually cures it...

denny / k8do - antenna monger from way back...

Another fine myth you've gotten us into, Ollie!

Let's not confuse "efficiency" with "gain". Efficiency asks, "Of the power that is incident at the feed point of the antenna, how much of that power is radiated into free space and how much is wasted as reflected or consumed in losses (matching or the elements themselves)?"

Gain asks, "For a receiver far distant (in terms of wavelengths) from the antenna, which antenna produces a higher signal strength?"

In the latter, which is what I presume you meant, we have to have a reference of some sort ... we have a fictitious impossible antenna called "isotropic", which says that all power is radiated from a point source that is infinitely small and infinitely efficient ... that is, all the power incident on the point is radiated equally in all spherical directions ... a radiating molecular seed at the center of an orange the size of Yankee stadium.

If you measure a perfect dipole with respect to this isotropic source, you find a "gain" perpendicular to the dipole elements of 2.14 dB. Where did this "gain" come from, since power can not be created by a passive antenna? If you look at the radiation pattern of a dipole, this apparent increase in power was caused by a deep hole in the pattern off the ends of the dipole. THe dipole, in essence, squeezed the top and the bottom to let the sides bulge out. Think of a donut dropped over the elements and sitting at the feed point of the dipole.

For the ground plane, think of that same donut cut in half through the fat part of the donut. Now since our "power" is really the volume of the donut, if you cut it in half, you are going to have to start out with a fatter donut if you are going to wind up with the same volume. Now drop that fat donut over the radiating element and let it come to rest on the center of the ground plane. The dipole radiated its energy so that half of it was "up" and half of it was "down". If "down" into the ground isn't what you wanted, then the ground plane, which radiates all of its energy "up" at some angle to the horizon, has more gain. By a clever bending of the ground plane wires down at some angle to the horizon, you can move that donut pattern down to where it is nearly horizontal. Thus, for a person at some far distance, a properly constructed ground plane will appear to have a stronger signal relative to a dipole.

Hi,

First off let me state that I'm a newbie in RF hardware so my apologies if this is a dumb question. For an experiment I'm conducting I want to be able to transmit two data streams from two WiFi(b) routers at the same time. I realize that they have carrier sense avoidance so that if they are right next to each other they will not transmit at the same time. Is there a piece of hardware (filter, diode? or something?) that i can put between the output of the routers and their respective antennas such that this device will pass the transmit signal to the antenna but not pass any radiation received from the antenna to the routers? The idea then would be that the carrier sense would not come into play as no power would be received from the antennas. Any ideas or suggestions would be greatly appreciated. Thanks,

Kev

A circulator would do the trick.

http://www.ditom.com/microwave-circulator.htm

https://ewhdbks.mugu.navy.mil/circulat.htm

Rather expensive, sometimes to be found on Ebay.

Reflections are functions of TIME, not frequency.

Oliver Heaviside had the right idea long before the invention of the
SWR meter.

They are both equally efficient. There's no reason why they should be
otherwise.

Hint : Try not to confuse efficiency with gain.

Thanks for the suggestion, a circulator/isolator is what i need. If
anyone has any suggestions on a bargain vendor I'd appreciate it.

Also as a follow up does anyone have a sense as to what the default
carrier sense power threshold is on WiFi routers in dBm? I've seen a
few isolators so far that range from 20dB to 40dB isolation, my router
puts out 20dBm so it would be good to know if one isolator will do the
trick. Thanks again.

Kev

It was a CQD actually....
but the point is,
the ham immediately alerted the Frankfurt, Olympic, Carpathia, et al and
told them to go save lives! Being simple Marconists however; they all said
'no' so the ham
grabbed his portable radio trunk, strapped a J-38 to his leg, jumped into
his skiff and madly paddled 46 hours straight out to the stricken ship, all
the while tapping
out rescue coordination efforts with his elbow, and.... wait... I forget,
where does it go from there?

Why would there be a significant problem in the first place....
these aren't CW devices, they are Packetized Spread Spectrum
and two devices next to each other, even on the same channel, would
not run into each other, due to different spreading code roots
anyway..... Hmmmmm, non problem, from where I sit.....

The Titanic knew their coordinates.... didn't slow the influx of H20....
The responding ships had radios too... didn't turn their props any
faster....

Answer to the question.... there was no system then.
CW can punch through if there is a human on the other end, where GPS/packet
says 'no signal'....
GPS is faster, where CW takes longer....
so one is obsolete, the other inferior.

Good Lord, are you saying that a 1 jigawatt transmitter and an Infinity
times Pi speed ham operator couldn't telepathically float a swamped ship,
and thwart hypothermia of people in the water???
How crass.

Can you tell I'm off today and quite bored? LOL

>anyone has any suggestions on a bargain vendor I'd appreciate it.

Ummm... realize that a circulator/isolator hooked between the antenna,
and the antenna jack of a typical 802.11b router, is going to dump
essentially _all_ of the incoming power from the antenna into its
dummy load.

This will include any power generated by the other AP's transmitter
and reflected back from the antenna.

It'll also include any power picked up by the antenna.

In short, the AP's receiver will "go deaf". It won't be overwhelmed
by transmitted signal from the other radio, but neither will it "hear"
the signals it's supposed to respond to.

That's fine if all you're doing is broadcasting/multicasting packets,
and don't need to accept packets or acknowledgements in return. It
won't work, however, with a typical 802.11b AP-and-client system, in
which the client device has to transmit to the AP in order to
associate with it.

I really don't know if an 802.11 AP is going to try to broadcast or
multicast packets if it "thinks" that there aren't any client devices
associated with it.

Wow.... so you could almost say the reason there was such a disaster
[notwithstanding the time period and simple circumstance] is that all these
radio operators [and companies] were acting like a bunch of egotistical
morons, each thinking their way to be better, and that most
vessels communications, wireless ops and policies were almost.....
amateur..... in nature?

LOL...

And I say I agree with the problem that mentioned for the cw being needed
and life saving station for the pc with no code.
It'll never work and if it does it will only be working a pc and if that is
not the person then it is not the same
so you can say it didn't work anyway because it wasn't a person that needed
it.
So there.

Well there ya have it folks.... 50wpm saves lives. So how does it work?
Turn up the speaker really loud and place it [face down] on the person's
chest, while
an op in South America tapped out universally accepted words that would
mimic an atrioventricular rhythm?

Wrong theatre? OK...

Maybe if a person is trapped on a sinking ship in the Indian Ocean you, in
Siberia, could tap out a message to someone in Madagascar [who happened to
be awake at an odd hour] and that person also owned a large SAR chopper,
they could jump in it, saving the time of relaying to anyone else, and go
pluck them from certain death?

OH, or better yet... if your neighbor is also a ham.... and your wife fell
over with an AMI, you could call your neighbor, give him a freq, then the
two of you
get set up and running, then you can send a 50wpm message asking your
neighbor to call an ambulance? BTW, if the phones are down, you ask him to
get in his
car and drive down to the local EMS agency, and bring them to you. Life
saved!
I'm impressed.

Yep, and a single point mentioning that if it were anything other than a
simple hobby, your arguments would matter.

But since it isn't...

Won't work.... memorizing is learning. You know where you live because you memorized it. You know what a diode is because you read it somewhere. Reading a book or taking a class on radio would require you retain [memorize] what you are told or read.

The information on radio should be kept secret, and the real test would be this:
Here's a radio. Take it with you. Come back in 30 days and explain how it works.

Then you get your owner's license, and can buy a radio.

Next test is to listen on-air to the CW [as there is no reason to use phone, if you already speak a language.] and figure out the code without any text or charts.

Then you get your operator's license.

When you can do that, then you can act like you've accomplished something.

This reply has absolutely no significance or meaning. It was just a good
place to add a reply.
Helps even out the sawtooth shape of the posts as I scroll down them.

>The Titanic knew their coordinates.... didn't slow the influx of H20....
>The responding ships had radios too... didn't turn their props any
>faster....

The year was 1912...NINETY-FOUR YEARS AGO.

>Answer to the question.... there was no system then.

The predecessor organization for SOLAS had not yet made 500 KHz
the international distress and safety frequency. "SOLAS" is an
acronym for Safety Of Life At Sea.

>CW can punch through if there is a human on the other end, where GPS/packet
>says 'no signal'....
>GPS is faster, where CW takes longer....
>so one is obsolete, the other inferior.

The International Maritime Community settled the 'morse issue.'
They DROPPED it in favor of GMDSS (Global Marine Distress and
Safety System), a semi-automated system which can be operated
by anyone of the bridge crew on a ship (it needs little
instruction on use). GMDSS messages are automatically routed
to ground stations (note plural) via satellite relay. Those
ground stations can coordinate rescue missions.

A shipboard GMDS station doesn't HAVE to have a GPS receiver
to feed it position data but all those which have one have
no complaint about this alleged "loss of signal." Position
data can be entered manually to a GMDS station. The bridge
crew will have a running record of the ship's position in
either event.

The United States Coast Guard has DROPPED continuous
monitoring of the 500 KHz distress frequency some years
ago. Several other countries have done so.

A following question is WHO will you believe on the efficacy
of communications? The entire international maritime
community or a bunch of myth-happy amateur morsemen?

In a sentient, intelligent mind, ANY form of communications
is good for use in matters involving life and death. The
FCC thinks (rightly) so and says as much in Part 1 of Title
47 C.F.R. [Part 97 is not the entirety of regulations on

amateur radio in the USA]

In a preceding message set:

>"Cecil Moore" <myc...@hotmail.com> wrote in message
>> Dave wrote:
>>> David G. Nagel wrote:
>
>>>> A ham operator intercepted the SOS from the RMS Titanic.
>
>>> Yep!! It happened once!

It happened NINETY-FOUR YEARS AGO.

>> If CW had not existed at the time, how would things have
>> turned out differently? If the present GPS-based system
>> had existed at the time, how would things have turned out?

I have to fault Cecil's erudite and intelligent mindset
on that...although his motor looks good in his picture. :-)

One CANNOT base any intelligent argument about ALTERNATE
universes of different times and places. It hasn't
happened in our present time-space continuum.

In 1912 "radio" was in its infancy, having been first shown
and demonstrated as a communications medium just 16 years
prior. There were extremely few ships which had vacuum
tubes as active devices to aid those first "radios." The
tube was only 6 years old, the triode invented in 1906.

To argue about "GPS" (which is not an integral part of
GMDSS but can be) versus morse code is ludicrous. GPS
relies on a time-frequency standard within each of the
24 GPS satellites which is comparable to the best time-
frequency source at NIST. [the quartz crystal
oscillator wasn't yet invented in 1912] Each satellite
needs solid-state circuitry to make it function within
a relatively small package. [the best "solid-state"
device of 1912 was a galena crystal detector with its
famous "cat's whisker"] The whole GPSS needed rocketry
advanced enough to put all the satellites into orbit.
[rocketry wasn't perfected for that purpose until after
WW2] Those rockets needed launch guidance aided by
radar systems. [radar, or rather a primitive system of
it, wasn't tried until 1932 in a harbor area of France]

However, "morse code" was used in the landline Morse-Vail
Telegraph System working before the American Civil War
and simple enough to turn a spark transmitter on and off
as on the Titanic.

>> Which system is presently inferior and virtually obsolete?

On-off keyed CW.

Except in the mindset of the ARRL. The IARU knows better.

Robesin is merely a product of the "incentive" licensing
system where all those who hunger for being a "somebody"
can get a Title - Rank - Privilege through a singular skill.

I didn't make that system, neither did you, neither did
anyone in these four forums. The FCC took a big chunk out
of it (license classes and morsemanship skill) with the
Restructuring of 2000 and that pissed off the Title-Rank-
Status seekers. Devout morsemen are angry and venting steam
because their self-esteem has fallen.

>> Robeson has been all full of himself in here about his alleged
>> "USMC service" yet he has presented zero-point-zero evidence
>> from anyone else (or any legitimate agency) that he ever
>> served on active USMC duty for any of his claimed "18 years."

Simply amazing. EIGHTEEN years alleged on active duty and
he can't supply a single photo or document to support his
claim? In November of this year I can truthfully say I've
been in the southern California aerospace business 50 years.
I have all sorts of documentation and photos on that which
I may fully digitize some day (some are already digitized).
Some time ago I posted my resume in here...which only made
Robesin ballistic then since he has NO comparable
experience in industry and cannot prove any radio experience
other than amateur and alleged "chief operator" status at
some small MARS station long ago. [that was before his
less-than-a-half-year as a purchasing agent at a small
set top box maker]

In another recent post, Robesin keeps referring to a "CV."
That's an acronym for the Latin 'curriculum vitae,' a list
of life experiences (education, work experience). In the
electronics industry, indeed in MOST industries, those
applying for jobs don't present a curriculum vitae, just a
RESUME of education-work experience. Some academics may
use "CV" but Personnel departments still look over resumes.

Just one more little gaffe on Robesin's part, trying to
LOOK experienced when he is NOT.

>> Even though he NOW thinks of himself AS the amateur radio
>> service personified (anything against him is somehow against
>> ALL radio amateurs), he is still parodying the "Emperor."

Another sign of his megalomania, purporting to "represent
all" and, by extension, anyone against Him is "against all
radio amateurs." Robesin desperately needs SOMETHING to
hold up his self-esteem and he uses amateur radio for that
selfish purpose. It is like his infamous snot-on-the-
moustache CAP flight suit picture, big on rank, title, and
with implications of status. CAP is NOT about amateur
radio but Robesin keeps on harping about it as if it
"proved" something about his amateur radio abilities. He
does the same with his "ER nurse qualifications" but those
have absolutely nothing to do with radio, amateur or
professional.

But, challenge Robesin or call him in error and one will be
inundated with personal insults. Robeson MUST be right and
he MUST rule. Civil comportment be damned with Robeson in
newsgroups. Those newsgroups were (in his mind) created to
showcase Him?

LenAnderson@ieee.org tried the same old tired rhetoric:

Huge snip of same stuff Lennie's trashed the NG with for years.....

> But, challenge Robesin or call him in error and one will be
> inundated with personal insults. Robeson MUST be right and
> he MUST rule. Civil comportment be damned with Robeson in
> newsgroups. Those newsgroups were (in his mind) created to
> showcase Him?

No, Lennie...All YOU had to do was start in with the Nazi terms,
elitist, etc etc etc.

Google archives refer.

I'd say you had a pretty good insight to yourself....

Hmmmmmm...Lessee......

> But, challenge (Anderson) or call him in error and one will be
> inundated with personal insults. (Anderson) MUST be right and
> he MUST rule. Civil comportment be damned with (Anderson) in
> newsgroups. Those newsgroups were (in his mind) created to
> showcase Him?

Yep.

Perfect fit.

Steve, K4YZ

====================================

Of course it doesn't. But at least it does try.

The meter thinks it indicates SWR on the transmission line, whereas it actually indicates SWR on a long, imaginary, non-existent, 50-ohm line between tuner and transmitter.

What sort of mess would Laurel & Hardy have found themselves in when trying to disentangle forward from reflected power?

I'm running 802.11b @ 2.4Ghz. As I understand it at 11Mbps (which I'm
using) the signal is "spread" using the CCK code, and each packet/user
uses the same spreading function. So a transmission only goes forward
if the channel is "empty", i.e. the received power at the transmitter
is below some carrier sense threshold (dBm)......

Yah let me clarify that, I have a hacked up router for running
experiments, all I'm using it for is to transmit broadcast packets, so
no receive information is necessary for my app....I just want to get
rid of carrier sense so that I can have more than one co-located tx
running at once...and as i see it the easiest way is a hardware fix.....

Owen,
For the benifit of innocent bystanders, he means the same magnitude discontinuity with the opposite sign. But you knew that of course, didn't you?

On the other hand, I'm not sure *I* have described it correctly. It can best be described in terms of the reflection coefficient.

There are two reflections, of opposite signs, which do not occur at exactly the same instant in TIME.

Whatever it is, Cecil is (im)perfectly correct.

Reg.

Hi All,

Spread Spectrum is merely the 0 level of the protocol stack and has
nothing to do with "going forward." That is a software issue at a
much higher level that deals with packet collisions. The hardware may
augment collision detection through carrier sense (which would only
occur if both share the same code). In fact, thresholds may be well
below the noise floor (dBm) and still work with notably lower
throughput, but this is an even more remote issue, except you may be
fighting poor isolation from even the best of isolators.

The ARRL is trying to soften their image - the latest QST shows a
person using a, gulp, microphone on the FRONT cover!

Just inside is yet another article on building a code key - from a door
hinge.

Hi Reggie,

You are in fact wrong in all accounts. Reflections are functions of
distance - as are echoes. This is a phase issue. Time and frequency
are always inseparable as Kelvin would instruct you in first
principles before another hunk of chalk was winged off your noggin.

You may choose to render phase into time, but shift the frequency and
the phase shifts, not the distance. Mismatched Zo connectors do not
shrink or enlarge with frequency - the effects may, but physical
components rarely follow such perturbations.... until an arc-over
that is the classic failure mechanism for such mismatches (obviously,
and deliberately ignored in this thread).

==========

The reason there are so many misunderstandings about SWR is that SWR meters are based on impedance and frequency. Not a simple concept.

Whereas reflections (echos) (which according to Cecil are what it's all about) are functions of time and distance. With which we are very familiar.

Unfortunately, there does not appear to be a simple measuring instrument which could replace the SWR meter. Any ideas?

But we would still need an instrument, a TLI, which indicates whether or not the transmitter is correctly loaded with 50 ohms. So perhaps things are best kept as they are.

Just rename the SWR meter!

Reg, G4FGQ.

Did someone drop you on your head at birth? The reason 50wpm can save lives is probably a bit complex for you to get both your functioning neurons around, but believe me, having done CW for a living for some decades I do know that it can save lives. And if you're faster than the average bear at it, you can tell someone on the scene things they need to know all that much faster.

So apparently YOUR answer to this question is that you couldn't send your name if your own life depended on it.

Believe me, I get it. I don't think CW ought to be mandatory and it isn't where I live. I do think people who intend to use it should learn how to use it properly, though. For CW to be effective, both operators must be competent. IF they are, they can often transcend barriers of language that only digital modes can get over. In my own case, the fact that I could read CW and read written Spanish a bit once enabled me to

render aid to a burning fishing boat. (There were other more routine examples of where the language barrier was crossed by CW--many messages I copied were not in English at all, but were readable by their end recipients).

Robesin an academic? Not in this lifetime.

It's just his inappropriate use of what to him are important sounding
words and acronyms.

The rec.radio newsgroups have showcased Robesin. He HAS earned his
reputation. He's worked very hard for it.

2826. Antenna wire

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-23 02:18:21 UTC
From: Owen Duffy <owen@no.where>
Message-ID: <5udne2hbro4lsmhg5d7kv0c5nb4bbglof3@4ax.com>
Source record: 54049

In searching the 'net for wire suitable for wire antennas, I came across a single core 2.7mm diameter 40% aluminium clad high tensile steel wire.

I am trying to get some further detail on its Guaranteed Breaking Strength, but my guess is that the steel core is probably somewhere about 1000 MPa UTS, and will give an overall GBS around 4kN.

The coating thickness looks like high conductivity aluminium, with a thickness of 300 microns, which is 5 skin depths at 1.8MHz, so conductivity should be good.

Apart from the challenge of making reliable connections to aluminium, are there other "issues" that come to mind in using such wire for antennas?

I was always under the impression the 2.15 dBi and 3 dBi applied to antennas in free space, the GP being on one side of an infinite plane at the fed end. Indeed in real would cases in the vicinity of earth or other large (relative to the antenna) objects the differances (particularly in FM service) become negligable. Note too: dBi is relative to a (theoretical) isotropic radiator (which is a mathamaticily logical standard of comparison), vs. dBd which is relative to an ideal center fed 1/2 wave dipole in free space.

Yep, im british.

I can see your point about the FCC complaints, lack of funding is the
usual reason for them not to bother to go after ham violators. If they
charged users then they would be able to use that money to go after the

retards who clog todays airwaves...

And the flamers/trolls havent driven us all off, we just go into hiding
until we see something of interest, and just ignore the rest...

indeed but you can't discuss any changes as I suspect you have ntoiced

and for that matter I have never seen why we have to have all of us
geting our license by the same path

indeed I have always liked an idea with some folks talking a rule and
safety test (and being confined to built equipment) and pay a fee while
others would takerigourous test and no fees

So basically ur saying that you should be able to either

1. Pay for your license and Take a beginner test (to prove your
competent)
or
2. Take a Intermediate Test and get free license after passing

If this is what you mean, then i can see your logic and i would fully
support a system like this...

Only problem is that just like Slow Code and the other trolls who try
to change the Ham world, we wouldnt be able to do anything either, its
down to the corporations, not us little people...

How else to follow your logic? As you can see, facile diversions are
easily managed in kind. ;-)

If you cannot reconcile distance to reflection, what use is it being
preserved in unzipped code? I await your next turn on the highway to
avoid this road-kill.

To cut the thread short, I recall one of your bedtime fairy tales of
how you fought a radar fire aboard an airplane. Cut it anyway you
want, but the fire undoubtedly arose from a mismatch. This appears to
have marked a trauma in your youth to avoid the discussion of mismatch
consequences.

Please, in the future, begin your posts with "Once upon a time..."
instead of

Sorry about the misspelling. I was trying to us the word
"complement" in the sense of "A numerical derived from a
given numeral by a specified subtraction rule. Often used
to represent the negative of the number represented by the
given numeral." Definition from "The IEEE Dictionary".

For instance, the reflection coefficient at the second impedance
discontinuity can be considered to be the complement of the
reflection coefficient at the first impedance discontinuity.

--------Z01---x---Z02---y---Z01-----------

The physical reflection coefficient at point 'x' would be
(Z02-Z01)/(Z01+Z02). The physical reflection coefficient at point
'y' would be (Z01-Z02)/(Z01+Z02). Mathematically, those two
reflection coefficients can be considered to be complements of
each other.

Hi Owen,

I've used ordinary house wiring for long-wires and they have survived
100# limb falls that ripped out my matching box from its post. The
survival was with the wire, not the box.

[warning to Reggie, the prose that follows contains literary
allusions]
What price tensile strength?

The worst thing you can do is pull a wire tight in an attempt to
totally eliminate sag. The inverse sine angle of its depression
magnifies the stress by huge amounts. A slight sag will never yield a
tensile failure in the most pedestrian of wire.

>--
>Pete . .
>ZS5ACT

I have had a three element SteppIR up for three years now.
It replaced a pair of Hy Gain monobanders (4 element 20 and 5 element
15).
Biggest difference I noticed was that my mast doesn't bend anymore !!
And my rotor has about 1/3 the work to do because the torque is so
much less.
And I have one feedline and no antenna switches, and only one
lightning arrestor.
And I now get 10 meters, and 17 meters. Wow what a great band 17
meters is.
Yes, I DO notice the pattern is not as sharp as the big monobanders,
no question about it. Probably a db or so less gain.

On 6 meters (I DO NOT have the extra fixed length element for 6
meters) I also have a 5 element M Squared, mounted about 6 feet above
the SteppIR. It absolutely blows away the SteppIR. So if you are
serious about 6, and don't want another yagi on the tower, give
serious consideration to the advice of Mike at SteppIR and get his 4th
element. I guess you said that, you are getting the 6 meter element.

But I miss that shiny aluminum up there. Sometimes the early morning
sun would reflect off all those Hy Gain elements..... Man, that was
a beautiful sight.

But 30 and 40 meters with the SteppIR? Seems like the only advantages
are the ones I mentioned above about the single feedline and
simplicity. I can't really see all that much advantage to being able
to rotate those single element radiators on those bands. I
experimented with learning EZNEC last week and I didn't see hardly any
directivity at all in my 40 meter inverted vee.

I think "ordinary house wire" may be aluminium, a by product of 110V
utilisation I guess. House wiring here is still principally copper.

Subject to more reliable information on the wire's GBS, my initial
calcs are that a span of 40m (half of a half wave dipole on 160m)
would need 3.3% sag (~1.4m) to survive wind at 60m/s with a safety
factor of 3.5. Yes, of course, the mountings must also survive the
wind, and this analysis assumes not deflection of the mounting points
and no stretch of the wire.

The only thing that compares on strength and conductivity is
Copperweld, but it is not easily obtained here... I suspect the cost
of freight might double or triple the price of a 100lb pack of 30% #12
wire.

I did look at heavy galvanised wires, but it seems the move has been
to Zinc/Aluminium alloy with an overall synthetic coating, and since
it erodes much slower, the coatings are only 10 to 20 microns... not
thick enough for good conductivity.

My usual supplier looks like he can't do 3mm HDC economically any more, hence the search.

>Maybe I'm missing something, who manufactures vertical vhf dipoles?

We're hams. We make our own antennas, don't we?
Two pieces of wire, and some insulators.

I had a vertical dipole for 2 meters once, a section of an old tv
antenna. One element (by definition) mounted on an insulator on a
boom. I attached the boom with two hose clamps onto my tower and
mouunted the single element out from the tower 3-4 feet. Attached a
piece of coax to the elements. Zero cost, used it for 15 years like
that.

Worked great. Wait a minute. On second thought how would I know
that? Ok let me rephrase that. "It worked." It's 2 meters, for
crying out loud - anything works. If you need gain you get a beam.

well maybe I am naive but if Ham could get it together to support
something different that was not hard to run (from the FCC's point of
view) I suspect we would get it

I've seen comments suggesting that steele core wire is not a good idea if you live in any kind of humid climate..... the cover clad develops pin-holes over time which allows moisture to start the rust process of the inner steel core. Breakage soon follows..... The comments I received were regarding copper clad, though. I don't know if aluminum would have the same potential problem or not.

Oh. My. God. ! ! !

Tsk, just because NBC, CBS, ABC, CNN, FOX, ESPN, and PBS haven't
covered the tremendously fantastic wonderfullest huge contribution
to saving lives and property via ham radio? Gosh, there are all
sorts of clippings from obscure weekly and biweekly newspapers
dutifully cut-and-pasted into messages here from Robesin & Co.

Maybe I'll have to write the Department of Defense and say that
"Major" Robesin said that radio amateurs run MARS! They should
fortwith cease and desist publishing DoD Directives on thinking
that they started it and keep running it!

Maybe I missed the "news" on the Home and Garden Channel...I don't
watch that much...

Right and all the other radio services are switching to morse
code for all emergency communications a la ham radio...the sky
has truly fallen!

>didit!

Dahdah comrade. :-)

Give up on Robesin, Mark. He MUST remain "right" and He
"must" rule. He isn't interested in civility. Once an
"enemy" of his, always an enemy in his mind. Sick way to
be but he is that way, repeatedly. He just proved it in
the message you replied to.

He is setting the example for all hams. Not going to help
the amateur ranks in getting more hams but that is not,
apparently, his point. Robesin needs to come out on TOP in
his own mind, be chieftan, be the warlord.

He also wants rec.radio.amateur. policy all his own to do with
as he sees fit. [probably to have his daily fits in...]

Ech...

> but titles like that are Robeson stock in trade my content in his posts
> just ranting on and on about epople instead of Issues

Absolutely true, Mark. He tries to belittle his "enemies" so that
He looks good. Problem is, it is working in reverse and he is only

belittling himself.

You could also get a second mortgage on the house and get the Steppir
Monstir and rotate 4 elements on 40M. It might mean a tower and rotor
upgrade but one can always dream.

Through the same antenna or seperate antennas? If one antenna, use a
Wilkinson combiner to isolate the xmitters so there's no intermod.

>I realize that they have carrier sense avoidance so that if
>they are right next to each other they will not transmit at the same
>time.

Sorta. 802.11 is CSMA/CA or collision avoidance, not collision
detection. It will do it's best to prevent simultaneous
transmissions, but it still can happen. The receiver will listen for
data, but will only wait until the end of the random contention time
period. Allegedly, it will wait 3 contention periods before
transmitting. Unfortunately, I've found that it will transmit anyway
after these 3 periods. This is to prevent broadband noise from
creating the ultimate denial of service attack and shut down all
wireless transmissions by transmitting continuous noise.
http://www.zytrax.com/tech/wireless/802_mac.htm

>Is there a piece of hardware (filter, diode? or something?) that

Others have suggested a circulator or isolator. That will work.
So will a hybrid ring.

>The idea then would be that the carrier sense would not come
>into play as no power would be received from the antennas.

It might be easier to simply disable the receiver section of your
unspecified wireless device. Many Wi-Fi router use seperate RF power
amplifiers in the TX path. That means there's an exposed T/R swich
somewhere on the board. Find it, chop the RX input line, ground or
terminate the RF input pin, and you're done. If you can identify the
radio chip, you should be able to easily find the RX pin.

2844. Re: Sommer design

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-23 05:57:43 UTC
From: David Thompson <thompson@mindspring.com>
Message-ID: <r7SGg.9539$Qf.9301@newsread2.news.pas.earthlink.net>
Source record: 53929

The Sommer design takes advantage of different elements phased to operate on all of the bands from 20 to 10. The longest element can be adjusted to operate on either 30 or 40.

One one band all the elements might operate as half wave elements but on another they would operate as 3/4 wave elements or even ful wave elements.

If properly assembled and adjusted (and that is not easy) the Sommer beam can be quite effective for the given boom length.

There was an execellent article in Dx magazine about how KM1E slected the Sommer XP708 over other antennas in late 1995.

> Should I believe this model?

Actually, that's pretty good. It's not uncommon to see quite good models hit around a half dB from perfect, i.e., average gain around +/- 12% from unity. Within that range, and even when the average gain is substantially worse, you can correct both the input resistance and gain with the average gain figure to arrive at an accurate result. (Refer to the NEC-2 or EZNEC manual for more information.) Poor average gain doesn't usually indicate instability, but rather problems with the way the assumed currents from the source overlap onto adjacent segments -- it's an excitation problem. Particularly problematic are wires of differing diameters, different segment lengths, and with bends in the immediate vicinity of the source. Your model has all three, so the average gain you're seeing is really good for that model.

Hi Owen,

Aluminium/um house wiring here was but a brief, failed experiment some
30-40 years ago.

>Subject to more reliable information on the wire's GBS, my initial
>calcs are that a span of 40m (half of a half wave dipole on 160m)

>and no stretch of the wire.

My wire tables offer that 40M of #12 wire would weigh 2.6 pounds in
bare copper. The breaking load would push beyond 100 times that at
337 pounds (40% copper clad is slightly more than twice that).

For a sag of 1.4 meters in 20 meters would be an angle of depression
of 4ï¿½. If I take the inverse of the sin(4ï¿½) it would multiply the
weight by 14.3 for a tension of 37 pounds. The wire by itself would
hardly constitute any jeopardy, but there is still a choke and
transmission line's weight to be added (and I probably missed this by
a factor of two in simply winging the math).

Let it sag 3 meters and the multiplier drops to less than 7.

At something like 4 dB additional loss, this may matter. Additional
sag would seem to be a very efficient return on investment in
comparison to the additional 1.6 meters proximity to earth (that

wouldn't nearly add 4 dB loss, would it?).

Hi Richard,

Thankfully, it didn't come here. I just Googled for "aluminium house
wiring fires" and got 1,080,000 hits, whereas for "copper house wiring
fires" I got 736,000 hits. I guess there may have been an issue.

Using that approximation, shouldn't you have taken the weight of a
half span? Then, isn't that weight evenly distributed over the half
span, so you should halve it again?)

A parabolic approximation is better than the triangular approximate,
and it would suggest tension is W*S^2/sag/8 or 0.28*40^2/1.2/8 N or
46.7N (~10.5lbf) which is a small fraction of the GBS of 1350N for

HDC, so yes, the wire is easily able to support itself. Wind forces are much greater, and wind at 60m/s (highest design speed for non-cyclonic localities under building standards here) loads the wire to 386N (which is GBS/SF). The lowest design speed under our standards is 41m/s, that results in about half the tension.

>hardly constitute any jeopardy, but there is still a choke and
>transmission line's weight to be added (and I probably missed this by
>a factor of two in simply winging the math).

I was considering a span with no concentrated loads (it is a quarter wave, half of a half wave dipole).

Yes to missing a factor or two. It is too late to be grinding numbers on your side of the world!

Do you mean a rope as a carrier for the conductor... runs into some other issues like differential stretch, and huge wind resistance. The structure may stay in the sky, but the wire might be fractured anyway.

COPPER-WELD

There are no issues of "reliable connections".

NOTE: Copper-weld is copper cladded steel wire. It's been used for years as a very reliable antenna with long spans. Catenary stresses are carried by the steel wire component.

I agree, a 2 meter dipole would take minutes to make. I was just
curious about manufacturer's published gain figures since I can't
recall ever seeing a manufactured 2 meter center-fed dipole --
apparantely there are a few out there.

To make things worse, there's a d-fructose and l-fructose.

D-tagatose is the all-natural un-sugar:
http://www.jhu.edu/~jhumag/1102web/sweet.html
I think I've seen it on store shelves. I'll check it out
if it's not too expensive.

A few years ago someone discovered an efficient
way to grow crystals of a specific handedness
from solution. So I'm surprised L-tagatose hasn't
totally replaced saccharin and phenylketoneurics.
Perhaps because some diseases ()like phenylketoneuria)
are associated with certain chiral forms?

Astrobioligists have suggested using chiral tests to
determine the presense of life on other planets since,
as far as they know, all life on earth has a preference
for (or immunity against?) one handedness over the other.
This suggested to them that perhaps once life developed
on a planet it would quickly bias all life on that planet
towards one of the two forms.

More on topic, should we be testing for circular polarization
radiation exposure levels on field strength meters?

It is interesting that Faraday rotation of linear polarization
can be described in terms of circular birefringence.
I can't tell if that's an analytical more than a physical description.

I see though the Faraday Effect is used in astronomy with oscillating pulsars but otherwise making a radio tuner in this manner would seem to present a problem of scales.

I'm confused about this since I've seen it said the higher frequencies of light are rotated more by Karo syrup, while another website says the higher radio frequencies are rotated less by the ionosphere due to the Faraday Effect than are the lower frequencies.

If I had to guess, I would think there would be only a certain band of radio frequencies where polarization rotation would make a practical radio tuner. Spintronics?

The only other thing that worries me is the placement of the feedline.
I plan run it at right angles to the vertical as much as possible.
After I built my 5-element yagi for MURS, I found that the SWR was
affected by the placement of the feedline. As such, I would like to
simulate its presence with NEC-2. Any hints about how to do this?

Thanks,

Hi Owen,

To say the least. The problem with aluminium/um house wiring was identified as "cold flow" where over time the mechanical joint would fail, increase resistance and electrical failure followed. Given the correspondence here on connecting aluminium/um, it appears that problem has been solved by professionals, but it would also seem to offer dim prospects in the housing industry.

>Using that approximation, shouldn't you have taken the weight of a
>half span? Then, isn't that weight evenly distributed over the half
>span, so you should halve it again?)

No, upon further investigation, my numbers appear to be ball-park without an order of two correction (other corrections may be necessary).

>A parabolic approximation is better than the triangular approximate,

More properly a "catenary" for sags which is a curve of constant tension; and for our antenna use, this is a classic application. The difference is slight in this regard as both involve hyperbolic transcendentals, but the point of constant tension is more to be noted. When we add the kicker of center feed weight, the curve is obviously pulled out (which suggests linear analysis).

From my 1912 copy of "Standard Handbook for Electrical Engineers" comes coverage of stringing power lines and calculating sag for a given tension. Tables and calculations are not remarkably different from my first approximation. This volume states "the working stress should not be over one fourth this [ultimate breaking strength]."

Perhaps if your dial is marked in THz.

2866. Working in strong 60Hz magnetic fields

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-23 18:32:31 UTC
From: kennnick@gmail.com
Message-ID: <1156357951.687505.203010@p79g2000cwp.googlegroups.com>
Source record: 53952

I'm a long-time reader of this NG and so realize that there is a lot of knowledge of EM principles on tap here. I'm pondering a non-ham issue from my workplace (a power plant) and could use a little education or peer checking of my ideas.

In the industry, there is occasionally a need to construct scaffolding below the main generator, up to the area where the main leads exit. Typically there are three leads (busses, phases) energized at 22kV phase to phase and carrying around 28,000 amperes. These busses are contained within individual aluminum ducts, creating sort of huge coaxial cables (three of them). The busses run through the turbine building and out to the transformer yard. The ducts are cross connected with welded plates at the ends and maybe at one or two intermediate locations to allow induced currents to circulate.

Here's the issue. Occasionally while erecting or removing such a scaffold with the unit at full power, there will be reports of arcing at the ends of scaffold poles (aluminum tube, I think) and of scaffold members becoming hot. There are lots of anecdotal stories of such events, and also of measuring from several to maybe 100 amperes in scaffold members, ground cables, structures and permanent piping in the vicinity.

Now, question or questions. Sifting through various stories and recommendations, I see recommendations to assure that the scaffold is well grounded. I'm not sure why this would help, assuming the currents (and arcing) are the result of magnetic induction. One recommendation is to ground only at one point, which makes sense to me.

I also see a lot of cautions about "static charge". It seems to me that any static charge would be the result of an electric field. And given that the busses (and generator) are enclosed in grounded metallic housings, this should not be a possibility. Is this correct?

One person recommended non-metallic scaffolding, which I like. But another wanted to assure that persons on that scaffold were grounded, which I'm not too sure about. I don't think it would be harmful in most cases, but I'd be concerned if the person and his ground happened to complete a current loop. Does that make sense? Again, I assume the grounding is for static charge concerns, which I don't see as valid.

It seems to me that structures built in the vicinity of strong 60Hz magnetic fields should either 1) avoid creating loops, including open loops that could have high voltage across the open ends, or 2) make sure the loops are intact and can carry the resulting induced currents.

Of course, #2 still makes disassembly while at power a problem.

Thanks for any opinions. I now return you to SWR, E-H, CM and G5RV.

Sorry, there is no EZNEC version for Linux. The last report I got was that the available Linux Windows emulator isn't able to open the EZNEC manual, and it has other problems with EZNEC also.

A printable form of the EZNEC manual can be downloaded from http://eznec.com/ez40manual.html. It's in both .rtf (rich text) and .doc MS Word) formats, though, so you'll have to be able to read one or the other of those.

Having no Windows system must be quite a handicap. It certainly limits the amount of software available to use.

Possibly, because try as I might, I can't really remember much about that
day.... I had pyloric stenosis, if that counts?

> So apparently YOUR answer to this question is that you couldn't send your
> name if your own life depended on it.

Now that's true... I'd require a CW setup of some kind in order to send my
name; or anything else for that matter.
Or as previously pointed out, hack up a headphone jack and tippy tap the
wires together. Either way, I don't see my life depending on it at any time,
so I'll just let my CW skills continue to rust.
However; your argument does make me wonder how non-hams even have a chance
at life in this world... ??

>

> recipients).

OK.... so by your own words, CW still didn't save a life... CW mixed with
bad Spanish passed a message. So now we'll have to add a Spanish test.
Thanks a lot.

As for the language thing.... I can copy voice language and hand it off to
another native just as easy and they'll figure it out too.

No CW necessary.

BTW, I noticed you conveniently left out the specific year in which said burning boat was offshore with an obsolete CW outfit, and how your CW expertise put out a fire.... but I'm guessing we're talking many a year ago, so again, a moot point.
Actually,
The boat thing in general is really killing me... If these numb-nuts are offshore and not on the correct USCG freqs and/or unaware of how to properly tune their radios in an emergency, then it isn't CW saving lives, it's the grace of God that somebody happened to be on their freq at that time. But again, what boats are out there with a CW rig???? That's crazy, bubba. :-)

Not an exact date, though it's probably in the archives of the Canadian Coast Guard, my employer at the time. Hey, I worked at Halifax Coast Guard radio from 1977 until 1995, 18 years at the one station. We handled a number of SOS calls on CW and were able to save lives some of the time (not always. alas). But with trained operators on both ends of the signal path, CW was pretty much always an easier go than SSB. And SITOR was pretty much a joke. Half the ships couldn't get it going.

INMARSAT is what put CW out of business in the marine industry. And a nasty solar flare or two could put INMARSAT out of business. You pays your money and you takes your chances. I'm not sure that a ship equipped with a complex satellite radio with a lot of moving parts and a technician is all that much better off than a ship was when they were equipped with an MF-HF CW and SSB radio station and a radio operator who was also a trained technician. All is well until something breaks and the nearest part is 500 miles away over water.

CW was still in use for a some ship-to-shore work when I retired in 1995.

When I went to the high arctic in 1964 it was our main means of communication with the south. We eventually converted that to RTTY and SSB, but neither was really as effective as the CW that preceded.

Now, today, we have such things a PSK31 to do much of the grunt work. That will work as well as CW in most cases, I find.

My point is, my bad Spanish might not have recognized the word "fuego" if it was spoken fast among a lot of other words. But on CW it came across loud and clear.

> As for the language thing.... I can copy voice language and hand it
> off to another native just as easy and they'll figure it out too.

Except you'll be a lot slower because you'll need phonetic spellings for everything. Believe me, I know. I've done this. For a living for many years.

Not that long ago, really. Early 1990's if I remember.

This was on 500khz (and 484). CW was the mode of operation on those frequencies until well into the 90's. Cheap SSB radios were plentiful. So were some SITOR lashups. But what finally killed it was INMARSAT.

So now, instead of getting nailed by solar flares on HF, you get nailed by them on INMARSAT and have to wait 6 to 9 months for a new launch. Meanwhile you're limping along on SSB using a phonetic alphabet to send traffic at a SLOWER rate.

I think you missed the point. Even if you didn't know "ola" from
"adios", you can copy Spanish in CW and hand it to the recipient, who
can read it. Try that with a mic.

>As for the language thing.... I can copy voice language and hand it off to
>another native just as easy and they'll figure it out too.
>No CW necessary.

Really? You can write a spoken language you don't understand well
enough to be read by someone who understands it? Maybe. Maybe not.
In CW, you can.

It depends upon what you want to do. I have not found it to be too
big of a limitation for what I do, and I have been using linux since
1992. I have also been an active supporter of open software for many
years (see <http://www.jedsoft.org>) and I have managed to code around
what I perceive as gaps.

For the antenna modeling, I use a slang script
(<http://www.jedsoft.org/slang/>) to search the parameter space for a
specified antenna geometry by minimizing a statistic. The slang
script runs nec and then runs a hacked version of xnecview to get the
gain and SWR as a function of frequency, and from that information
computes the statistic.

Don't forget thought that solar flares and especially the aurora they create
induce a phase shift in signals and that wipes out PSK31.

I do that firaly well as long as it is a a langauge fro gruop I know I
can take down serbian in crylllic even though I don't what they are
saying it is simply a skill For that matter I hear and resend Morse as
long as I don't try to decipher it
>
> >As for the language thing.... I can copy voice language and hand it off to

YOU can and you then claim that you have that skill it is valid

your values in the ARS refuse to accept that notion different strokes
for different folks

If instead of CW testng we had a choice a various tests to take that
would stand muster the current value Morse well outside of it value
withut even realy testing its abilty to do a QSO were the test based
sending and receiveing where the receiveing could send bak pse senf all
after ... and before what then take a test to show that he was able to

comincate the test would have more vailiity but it doesn't the CW tests
do noy even show that the testee can use CW over the air

I think you are on the right track. the problem in locations like that is not 'static' charge, but induced current. induced current requires a loop. typical scaffolding with metal frames that typically look like big square loops would make great pickups for those fields. some people may be confusing the arcs caused by breaking a loop with static charge, which it definitely isn't.

I kind of like the non-metallic scaffolding idea, that would be a great way to avoid most of the problems.

The one thing to definitely avoid is to ground the personnel... consider this, two grounded people on an insulated platform touch, thus completing a loop that consists of them and their ground wires... could be a shocking experience. they would also end up in the middle of a loop any time they touched another piece of metal that happened to have a path to ground.

with the cables at least partially shielded by the conduits I'm not sure if the fields would be high enough to cause heating of things like bracelets and neck chains... but it might be something to test out and see if prohibiting that type of stuff would be in order. it should be fairly easy to test when you have access to a setup near the generator by using a clamp on ammeter on the legs of the scaffolding... preferably somewhere that it forms a loop rather than on a dead ended pipe.

>>purposes" instead of "for I.D." While taking longer to say, it is worth
>>more "LID points".
>>
>>Step Five: The better the copy on two meter FM, the more you should use
>>phonetics. Names should be especially used if they are short or common
>>ones. I.E. "My name is Al... Alpha Lima" or "Jack.. Juliet Alpha Charlie
>>Kilo." If at all possible use the less common HF phonetics "A4SM...
>>America, Number Four, Sugar Mexico." And for maximum "LID points", make
>>up unintelligible phonetics. "My name is Bob... Billibong Oregano
>>Bumperpool."
>>
>>Step Six: Always give the calls of yourself and everyone who is (or has
>>been) in the group, whether they are still there or not. While this has

>>been unnecessary for years, it is still a great memory test. You may
>>also use "and the group" if you are an "old timer" or just have a bad
>>memory. Extra points for saying everyone's call and then clearing in a
>>silly way "K2PKK, Chow, Chow."
>>
>>Step Seven: Whenever possible, use the wrong terminology. It keeps
>>people guessing. Use "modulation" when you mean "deviation", and
>>vice-versa.
>>
>>Step Eight: If someone asks for a break, always finish your turn, taking
>>as long as possible before turning it over. Whenever possible, pass it
>>around a few times first. This will discourage the breaker, and if it is
>>an emergency, encourage him to switch to another repeater and not bother
>>you.
>>
>>Step Nine: Always ask involved questions of the person who is trying to
>>sign out. Never let him get by with just a "yes" or "no" answer. Make it
>>a question that will take him a long time to answer.
>>
>>Step Ten: The less you know on a subject, the more you should speculate
>>about it in the roundtable. Also the amount of time you spend on the
>>subject should be inversely proportionate to your knowledge of the
>>subject even though you have no damn clue.
>>
>>Step Eleven: Always make sure you try to communicate with only a
>>handheld and a rubber duck antenna. Also, make sure you work through a
>>repeater that you can hear very well, but it cannot hear you. This will
>>put out a kind of "LID mating call": "Well, Joe, I can hear the repeater
>>just fine here. I wonder why it can't hear me?" You will score maximum
>>LID points if you are mobile, and with the radio lying in the passenger
>>seat.
>>
>>Step Twelve: If you hear two amateurs start a conversation, wait until
>>they are twenty seconds into their contact, and then break in to make a
>>call, or better yet to use the auto-patch. Make sure you keep the
>>repeater tied up for at least three minutes. This way, once the two have
>>re-established contact, they won't even remember what they were talking
>>about.
>>
>>Step Thirteen: You hear someone on the repeater giving directions to a
>>visiting amateur. Even if the directions are good, make sure you break
>>in with your own "alternate route but better way to get there" version.
>>This is most effective with several other "would-be LIDs", each giving a
>>different route. By the time the visiting amateur unscrambles all the
>>street names whizzing by in his mind, he should have moved out of the
>>range of the repeater. This keeps you from having to stick around to
>>help the guy get back out of town, later.
>>
>>Step Fourteen: If an annoying station is bothering you, make sure your
>>other "LID" buddies have a "coded" frequency list. Even though "CODES"

>>are strictly forbidden on Amateur Radio, it's really neat to practice
>>"James Bond" tactics.
>>
>>Step Fifteen: Always use the National Calling Frequency for general
>>conversations. The more uninteresting, the longer you should use it.
>>Extra points are awarded if you have recently move from an adjacent
>>frequency for no reason. Make sure when DX is "rolling" in on 52.525
>>that you hang out there and talk to your friends five miles down the
>>road about the good old CB days!
>>
>>Step Sixteen: Make sure that if you have a personal problem with
>>someone, you should voice your opinion in a public forum, especially a
>>net. Make sure you give their name, call, and any other identifying
>>remarks. For maximum points, make sure the person in question is not on
>>the repeater, or not available.
>>
>>Step Seventeen: Make sure you say the first few words of each
>>transmission twice, especially if it is the same thing each time. Like
>>"roger, roger" or "fine business, fine business". I cannot stress enough
>>about encouraging redundancy.
>>
>>Step Eighteen: If you hear a conversation on a local repeater, break in
>>and ask how each station is receiving you. Of course they will only see
>>the signal of the repeater you are using, but it's that magic moment
>>when you can find a fellow "LID", and get the report. Extra points are
>>awarded if you are using a base station, and the repeater is less than
>>twenty-five air miles from you.
>>
>>Step Nineteen: Use the repeater for an hour or two at a time, preventing
>>others from using it. Better yet, do it on a daily basis. Your quest is
>>to make people so sick of hearing your voice every time they turn on
>>their radio, they'll move to another frequency. This way you'll lighten
>>the load on the repeater, leaving even more time for you to talk on it.
>>
>>Step Twenty: See just how much flutter you can generate by operating at
>>handheld power levels too far away from the repeater. Engage people in
>>conversations when you know they wont be able to copy half of what your
>>saying. Even when they say your uncopyable, continue to string them
>>along by making further transmissions. See just how frustrated you can
>>make the other amateur before he finally signs off in disgust.
>>
>>Step Twenty One: Use lots of radio jargon. After all, it makes you feel
>>important using words ordinary people don't say. Who cares if it makes
>>you sound like you just fell off Channel 19 on the citizen's Band? Use
>>phrases such as "Roger on that", "10-4", "I'm on the side", "Your making
>>the trip" and "Negatory on that".
>>
>>Step Twenty Two: Use excessive microphone gain. See just how loud you
>>can make your audio. Make sure the audio gain is so high that other
>>amateurs can hear any bugs crawling on your floor. If mobile, make sure

>>the wind noise is loud enough that others have to strain to pick your
>>words out from all the racket.
>>
>>Step Twenty Three: Start every transmission with the word "Roger" or
>>"QSL". Sure, you don't need to acknowledge that you received the other
>>transmission in full. After all, you would simply ask for a repeat if
>>you missed something. But consider it your gift to the other amateur to
>>give him solace every few seconds that his transmissions are being
>>received.
>>
>>Step Twenty Four: When looking for a contact on a repeater, always say
>>your "listening" or "monitoring" multiple times. I've always found that
>>at least a half dozen times or so is good. Repeating your multiple
>>"listening" ID's every 10 to 15 seconds is even better. Those people who
>>didn't want to talk to you will eventually call you, hoping you'll go
>>away after you have finally made a contact.
>>
>>Step Twenty Five: Always use a repeater, even if you can work the other
>>station easily on simplex ... especially if you can make the contact on
>>simplex. The coverage of the repeater you use should be inversely
>>proportional to your distance from the other station.
>>
>>Step Twenty Six: When on repeaters using courtesy tones, you should
>>always say "over". Courtesy tones are designed to let everyone know when
>>you have unkeyed but don't let that stop you. Say "over", "back to you"
>>or "go ahead". It serves no useful purpose but don't worry, it's still
>>fun!
>>
>>Step Twenty Seven: Use the repeater's autopatch for frivolous routine
>>calls... especially during morning or evening commute times. While
>>pulling into the neighborhood, call home to let them know you'll be
>>there in two minutes.... or, call your spouse to complain about the bad
>>day you had at work. After all, the club has "measured rate" service on
>>their phone line so they get charged for each autopatch call. Your
>>endeavor is to make so many patches in a year that you cost the club at
>>least $20 in phone bills. That way you'll feel you got your money's
>>worth for your dues!
>>
>>Step Twenty Eight: Never say "My name is ....." It makes you sound
>>human. If at all possible, use one of the following phrases: a) "The
>>personal here is ..." b) "The handle here is..."
>>
>>Step Twenty Nine: Use "73" and "88" incorrectly. Both are already
>>considered plural, but add a "s" to the end anyway. Say "73's" or
>>"88's". Who cares if it means "best regards" and "love and kisses."
>>Better yet, say "seventy thirds"! (By the way, seventy thirds equals
>>about 23.3).
>>
>>Step Thirty: If the repeater is off the air for service, complain about
>>the fact that it was off the air as soon as it's turned back on. Act as

>>though your entire day has been ruined because the repeater wasn't
>>available when you wanted to use it. Even thought you have never paid a
>>penny to help out with the upkeep of it.

Markie, Thanks for the re-post.

You saved my the trouble of having to post it this month.

>73--Nick, WA5BDU

I'm no expert on this but it sounds to me like the magnetic fields around the busses are inducing eddy currents in the scaffolding as opposed to actual current flowing around the square sections in a loop. The conduits surrounding the busses will be "thin" skin-depth wise at 60 Hz so a large amount of field gets through. I'm actually kinda curious as to why the conduits themselves arn't getting really hot :?.

I'd suggest posting on sci.electronics.design, I'll bet somebody there knows about this...

H.

2887. Can't find enameled copperweld antenna wire

Newsgroup: rec.radio.amateur.antenna
Date: 2006-08-24 00:15:50 UTC
From: "John, N9JG" <John@Xremove.meYgotwals.com>
Message-ID: <Wc6Hg.199$5i7.174@newsreading01.news.tds.net>
Source record: 53972

The last time I installed a wire antenna for 80 meters was in the mid 70s. At that time the wire of choice was #14 (or perhaps #12) solid enameled copperweld (now called copper clad) wire. Yes, the wire was kinky, fussy to install, but it had high mechanical strength, excellent electrical properties, and it lasted for many years.

I have moved to eastern Tennessee, and because of circumstances, I want to revert back to a wire antenna, at least for the time being. Much to my surprise I can not seem to locate a source of solid enameled copper clad wire. Is there any reason why this wire is no longer available?

I will be suspending the wire between the chimney and the trunk of a tall tree and plan to put a galvanized screen-door spring in series with the support at one end. The span will be about 120 feet.

The WireMan offers several types of wire, such as "Fabricated 14 AWG solid copper clad steel (30%). The best choice for long-lived, high performance antennas in any environment. Breaking strength 550 lbs.", but this wire is not enameled. (13¢/ft)

Another choice from the WireMan is "'Silky' 12 AWG, 19 strand, tinned, 40% copper-clad steel. Smooth as silk, tight lay, engineered antenna wire as close to solid performance as possible, but flexible and easy to use. Our heaviest - overkill for most work. Break strength 474 lbs." This wire is stranded and tinned. (22¢/ft)

Finally, the WireMan offers "Toughcoat 'Silky' 13 AWG, 19 strand 40% copper-clad steel (OD 0.0795") with tough, high density, low-gloss polyethylene (Nominal OD, 0.120" including 0.020" jacket. Designed for through-the-trees, sea coast, acid rain or other inclement atmospheric conditions. Our most rugged, longest-lived, stranded antenna wire for any purpose. Jacket has minimal effect on performance - less than that of a year's accumulation of oxidation product on bare wire, with less noise." (21¢/ft)

Any advice, recommendations, or links to wire sources will be greatly appreciated.

John, N9JG

>were with all the layers of hamdom.

All of those "layers" hams are examples to the general public,
good or bad or indifferent. So?

"Self-esteem" is a nice-nice word for EGO tied in with self-
perception. Trying to represent themselves as "expert" radio
persons in this new millennium is a rather stupid idea of those
devout morsepersons when they want to force the FCC to keep the
code test.

Those who LIKE morse code should, and can, go on using it. That
is in no sense any validity for making it an amateur radio test
requirement for a license.

It's easy to "get." He wasn't what he says he was. He hasn't
supplied a single bit of evidence to prove his claims.

>> In another recent post, Robesin keeps referring to a "CV."

He tries to "spin" his claims to be the truth. Still no
evidence presented.

Robesin used the wrong word/acronym for a RESUME' presented
as part of an interview for a job.

>Robesin an academic? Not in this lifetime.
>
>It's just his inappropriate use of what to him are important sounding
>words and acronyms.

Some of those he makes up as he goes along.

>The rec.radio newsgroups have showcased Robesin. He HAS earned his
>reputation. He's worked very hard for it.

He's hardly worked in radio.

Bare copper or Copperweld has served me well everywhere I've lived. The only time I've had a problem with it was at the coast, about a block from the ocean where the air nearly always contained a fog of salt water droplets. There, a copper wire turned into blue powder in less than a year. I suppose you could have similar problems if you're downwind from a coal-fired plant or something. So if you have a very severe atmosphere, get the coated Wireman stuff. Otherwise, bare Copperweld will do as well.

I use the Wireman's Silky 16 AWG for an 80 meter dipole. Tree limbs
have fallen on it, but it still hasn't broken (I think the screen door
springs at each end help). Any of his heavier stuff should hold up
fine.

Spanish words are easy to write even if one doesn't
understand them. In general, unlike English, there
is usually only one possible way to pronounce and to
spell a Spanish word. You hear "a-di-os". You write
a-d-i-o-s. You don't need to know what it means.

Lessee. He's got a Marine uniform (he says). A Tennessee State Guard uniform (whatever that is), an ill-fitting Air Force CAP flight suit uniform, and a male nurses uniform. And he has lots of military medals that he never earned (according to him).

You know, whenever I saw folks in the CAP uniform at any Air Force Base, including Maxwell, they work the 4b or Class A. Never ever saw a CAP in a flight suit before robesin's well advertised home page.

Some do. Some don't. robesin does.

> Those who LIKE morse code should, and can, go on using it.

Roger.

No valid reason to maintain it as a barrier to the ARS.

Probably how his career in the Marines was invented.

Oh, I don't know. After a hard day behind the microphone, he's got
that 1,000 yard stare.

Wow! We almost leaped from a door hinge to a jar head.
